Make a little of everything.

Seven studios. An optional shared desk. A guide to getting started and going further.

Meet JAGO Suite

Draw an illustration, build a pattern, explore a world, craft a surface or make your own soundtrack. Start wherever your idea needs you. Each studio stands on its own, and the suite gives you useful ways to connect them.

This guide starts with simple introductions and small first projects. The toolbox pages give the fuller feature reference, while the closing pages help you choose exports and connected workflows.

Open source. Free forever.
Release guide: Suite 2.8.0 | October 2026

Find your next idea.

Workscape 5

An optional tabbed home for Jago studios, with working pairs, detachable tabs and editable workspace saves.

Wobble 10

Draw, wobble and animate. A free drawing studio for lively illustrations and frame-by-frame loops.

Dither 15

Turn artwork into printed textures, limited-colour images and animated dithering. Free, local and editable.

Repeat 20

Build seamless artwork patterns, paint repeating textures and make scrolling strips. Free and editable.

World 25

Connect characters, lore, maps, family trees and timelines in a free worldbuilding and writing studio.

Material 30

Make wood, glass, metal and textured artwork, with editable shapes, lettering, finishes and surface maps.

Sound 35

Make music, effects and ambience your way. Editable songs, seeded ideas and a sound workshop that starts from scratch.

Library 41

Browse assets and fonts, organise collections, build layouts and work with PDFs. A free creative library.

Connected workflows & export reference **47**

The contents entries are clickable. PDF bookmarks let you jump between studios. Each studio also has its own smaller guide in this pack.

What would you like to make?

Wobble

Draw, wobble and animate. A free drawing studio for lively illustrations and frame-by-frame loops.

Dither

Turn artwork into printed textures, limited-colour images and animated dithering. Free, local and editable.

Repeat

Build seamless artwork patterns, paint repeating textures and make scrolling strips. Free and editable.

World

Connect characters, lore, maps, family trees and timelines in a free worldbuilding and writing studio.

Material

Make wood, glass, metal and textured artwork, with editable shapes, lettering, finishes and surface maps.

Sound

Make music, effects and ambience your way. Editable songs, seeded ideas and a sound workshop that starts from scratch.

Library

Browse assets and fonts, organise collections, build layouts and work with PDFs. A free creative library.

Workscape

An optional tabbed home for Jago studios, with working pairs, detachable tabs and editable workspace saves.

A comfortable first session.

Download and open

Download the ZIP, right-click it and choose Extract All. Run the short Jago studio .exe from the extracted folder. Keep its included support folders. No installer is needed for the portable apps.

Windows or browser

The Windows apps require 64-bit Windows and Microsoft WebView2 Runtime. The individual studio HTML files can run offline in your browser. Workscape and Windows font/PDF integration are native Windows features.

Save as you go

Save your native project for editable layers, drawings, musical notes or world data. Export a finished image, audio file or reference pack separately. Local recovery helps, but a saved project is your portable backup.

Find the important things

New, Open, Save and Export handle your document. Resources brings together examples, shared tools and useful extras. The ? opens help, appearance, shortcuts and rights information.

Choose your appearance

Sketchbook, Charcoal, Paper, Plum, Candy, Forest and Blueprint give the shared tools a familiar look. World also has specialist appearances. Workscape can match studio appearances to the shared desk.

Move around

Most canvas studios offer pointer-centred wheel zoom, Fit and a 1:1 view. Middle mouse pans where supported. Use each studio's shortcut reference for its editing commands; typing in a text field keeps normal text-editing behaviour.

Keep the full bundle together

The bundle already gives Workscape its studio locations. Manage studios & versions lets you explicitly choose another release; Workscape does not search every drive for the latest version automatically.

Jago Workscape

One desk. Your way of working.

An idea rarely stays in one tool. Jago Workscape gives your Jago studios a shared desk, so you can draw in one tab, find a texture in another and keep a working pair beside each other.

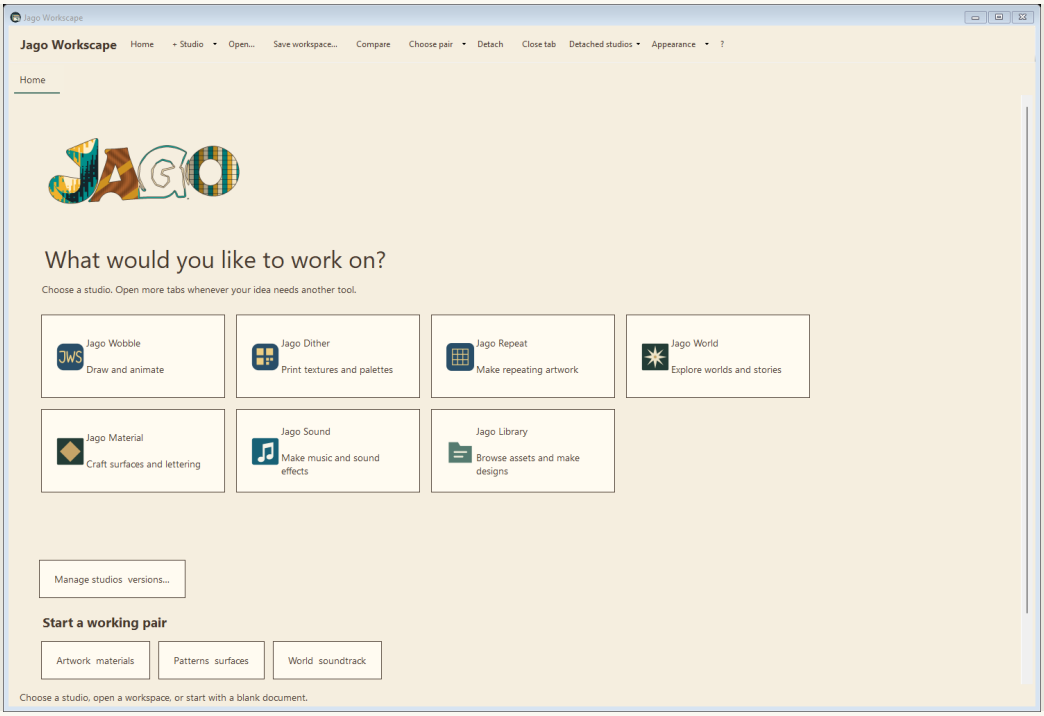

A good place to begin

An optional tabbed home for Jago studios, with working pairs, detachable tabs and editable workspace saves.

Inside this guide
Start with a small project. Explore the toolbox. Choose the right export. Take the result into another studio.

Start small. Make it yours.

1. Choose a studio

Open Jago-Workscape.exe and select a studio from Home. Add more studios as tabs when the work needs them.

2. Choose your pair

Use Compare and Choose pair to work with two studios together. Swap or stack the pair; click Compare again to return to one view.

3. Arrange your desk

Drag tabs to reorder them. Detach a studio into its own window, then use Detached studios to bring back one or all.

4. Keep the working setup

Save a workspace and save the documents in their studios. Manage studios & versions chooses which installed release new tabs will open.

Your toolbox

Choose your desk

Open a studio from Home, add more tabs and reorder them by dragging.

Each tab keeps its own document and undo history.

Right-click a tab to move, duplicate, detach or close it.

Bring detached studios back individually or all together while they remain open.

Studios load when selected; hidden tabs pause/suspend where supported.

Work side by side

Compare creates a working pair of open studios; clicking again returns to one view.

Pick the pair, swap sides or stack the views.

Moving between the paired tabs keeps both visible; visiting another tab pauses the pair until you return.

Send to studio can target existing tabs, new tabs or separate windows.

From standalone, Open both projects in Workscape brings a copy of the source alongside the destination.

Keep the workspace

Save editable studio documents and the working arrangement in a .jagoworkspace file.

Use Home recovery when needed, while keeping regular project backups.

Choose studio releases through Manage studios & versions; see the version and exact path used for new tabs.

Use bundled copy restores the bundle choice. Existing tabs retain their running versions.

Choose seven appearances and optionally match studios to Workscape; World maps matching choices to its specialist appearance.

Take it further.

Save the editable source

Your native project keeps the studio-specific editing information. Save it before making finished exports or passing a rendered result to another tool.

Export options

Editable .jagoworkspace files
Ordinary project saves and exports remain available inside each studio

Any studio

Open a studio as a tab while retaining its own document and tools.

A working pair

Compare a source and destination without replacing either document.

Standalone windows

Detach or send to a separate studio window when that fits your work better.

Useful things to know.

Workscape is Windows-only and requires the studios; its standalone ZIP does not contain all seven applications.

It does not automatically scan drives for the newest release. Chosen paths determine new tabs.

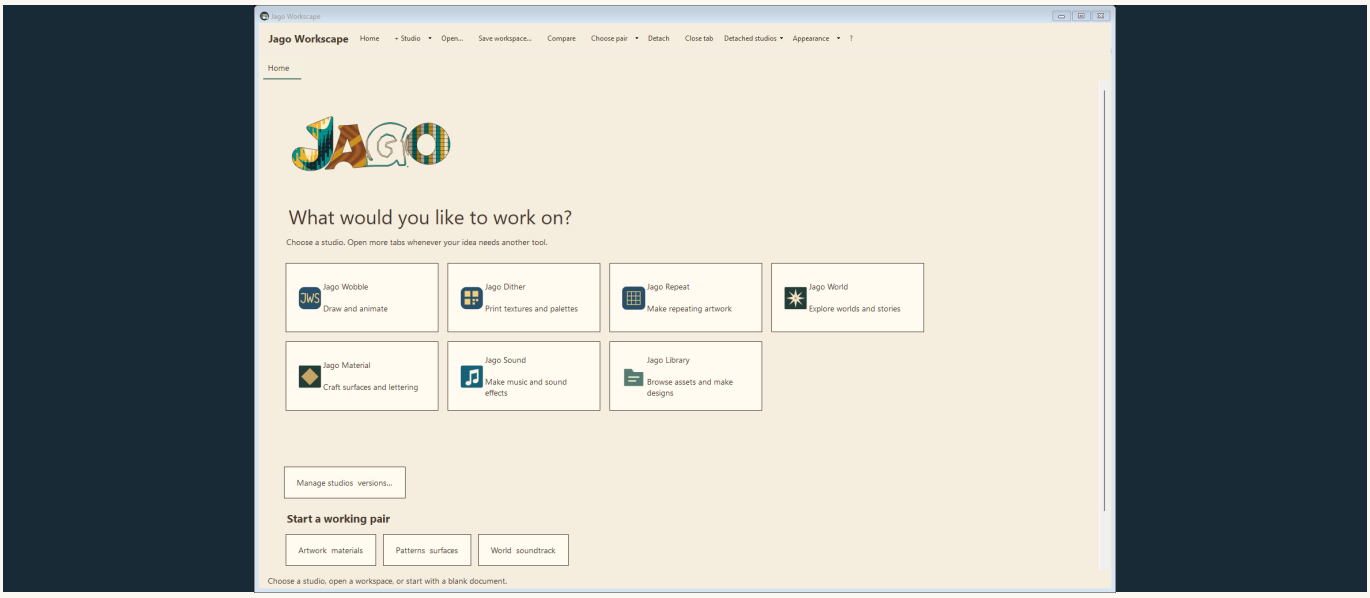

External Library references still need their original files.

Live detached tabs can be brought back while they remain open; saving a workspace is the portable checkpoint.

Open it again

Download the ZIP and choose Extract All. Open Jago-Workscape.exe from the extracted folder. For offline browser use, open the individual studio HTML files. Workscape is a Windows companion. Keep native support folders with their Windows app.

Personal, professional and commercial use are welcome. The apps are open source and free forever. Check the rights of any fonts, images, scores or other assets you import.

Another direction to explore with Jago Workscape.

Jago Wobble

A little life in every line.

Draw something lovely, something wonky, or something that refuses to stay still. Jago Wobble is a drawing and animation studio for illustrations, little loops and artwork with a bit of life in it.

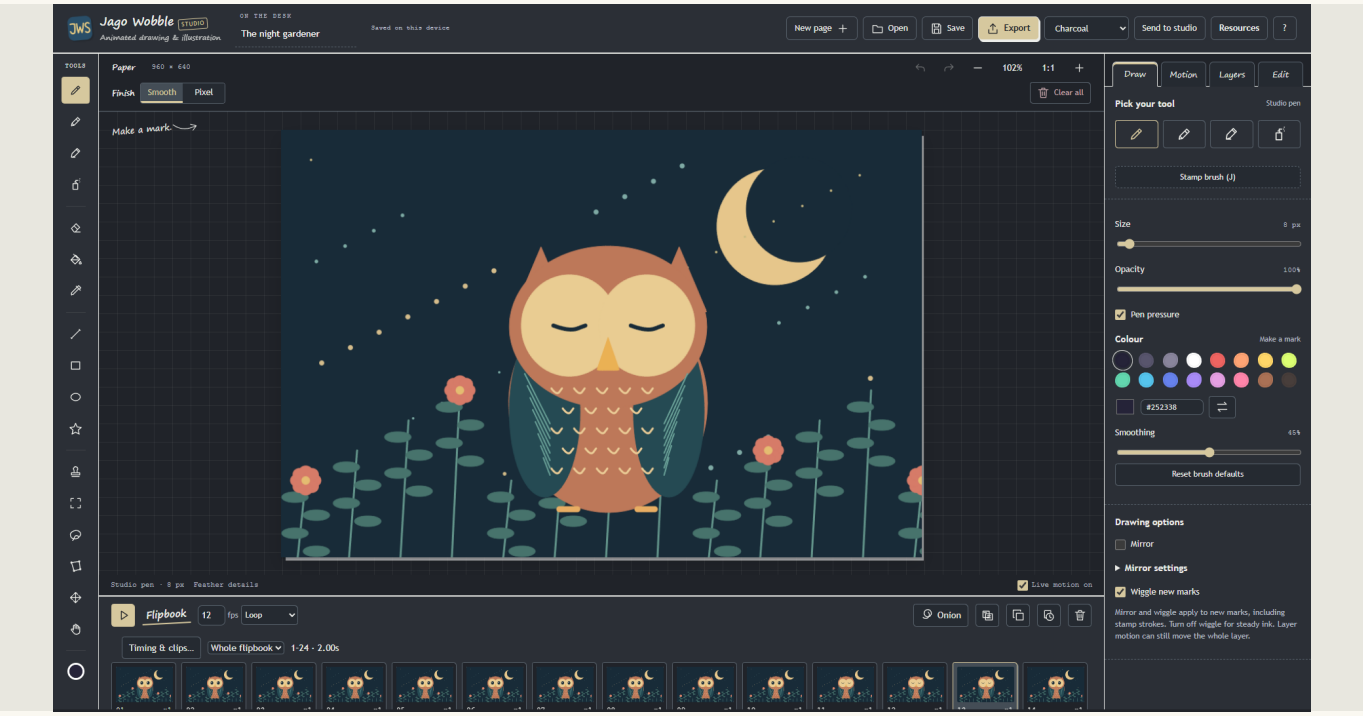

A good place to begin

Draw, wobble and animate. A free drawing studio for lively illustrations and frame-by-frame loops.

Inside this guide
Start with a small project. Explore the toolbox. Choose the right export. Take the result into another studio.

Start small. Make it yours.

1. Start a page

Choose New page. Pick the canvas size, then make a few marks with the pen or a shape tool.

2. Keep it editable

Put the subject, background and details on separate layers. Use selections to move, resize and rotate artwork.

3. Give it life

Add or duplicate frames in the Flipbook, change the drawing and set frame holds. Try onion skin or motion on a layer.

4. Take it away

Export a still PNG, a GIF or a timed PNG sequence. Save the .jago project too, so the drawings stay editable.

Your toolbox

Make your marks

Drawing tools include pens, shapes and stamp brushes, with size, colour and opacity controls.

Keep artwork on layers, use clipping where useful, and move, resize or rotate selections.

Choose smooth drawing or a native pixel canvas. A pixel finish also lets you explore a pixel treatment of smooth artwork.

Optional pixel-perfect thin strokes remove doubled corners; thin erasing follows the same geometry.

Undo and redo let you explore without committing to the first idea.

Make it move

Animate frame by frame with blank or duplicated frames and adjustable frame holds.

Named animation sections let you keep a walk, blink or other little sequence inside a larger flipbook.

Choose forward, reverse or ping-pong playback for the selected section.

Onion skin shows neighbouring drawings, with opacity, fading, active-layer and loop-wrap controls. Guides stay out of exports.

Motion tools let you animate marks or layers without drawing every change by hand.

Attach project audio for a combined preview while keeping the original sound file available.

Get comfortable

Zoom around the pointer, pan with middle mouse, fit the page or inspect it at 1:1.

Use editable examples, shared appearances and the in-app help when you want a starting point.

Sprite delivery offers transparent padding, native integer enlargement and an optional export palette.

Take the drawing further

Send a rendered still or loop to Dither for inks and print effects, Repeat for patterns, or another Jago studio.

Transfers can carry the original project too. Keep that original when you want to return to editable drawings.

Take it further.

Save the editable source

Your native project keeps the studio-specific editing information. Save it before making finished exports or passing a rendered result to another tool.

Export options

Editable .jago projects
PNG stills
Animated GIF
PNG frame sequences with timing information
Sprite sheets with JSON frame positions, playback order and holds

Dither

Turn a drawing or loop into a limited-palette print.

Repeat

Turn a small illustration into a pattern motif.

Material

Use a rendered drawing as artwork or an animated source.

Library

Keep the finished drawing with the other assets for a project.

Useful things to know.

GIF uses a limited palette and hard transparency; PNG preserves soft transparency.

Visual exports are silent. Attached audio is for project preview; combine the exported sound and visuals in your video editor.

Thin-stroke pixel correction is optional; it does not change every brush or shape into a pixel-perfect tool.

Open it again

Download the ZIP and choose Extract All. Open Jago-Wobble.exe from the extracted folder. For offline browser use, open Jago-Wobble.html. Workscape is a Windows companion. Keep native support folders with their Windows app.

Personal, professional and commercial use are welcome. The apps are open source and free forever. Check the rights of any fonts, images, scores or other assets you import.

Another direction to explore with Jago Wobble.

Jago Dither

Pictures into patterns.

Bring a favourite picture to the print table. Find a few good inks, make the texture crunchy or gentle, and see what happens when the marks start moving. Jago Dither is a print workshop for images, lettering and little animated scenes.

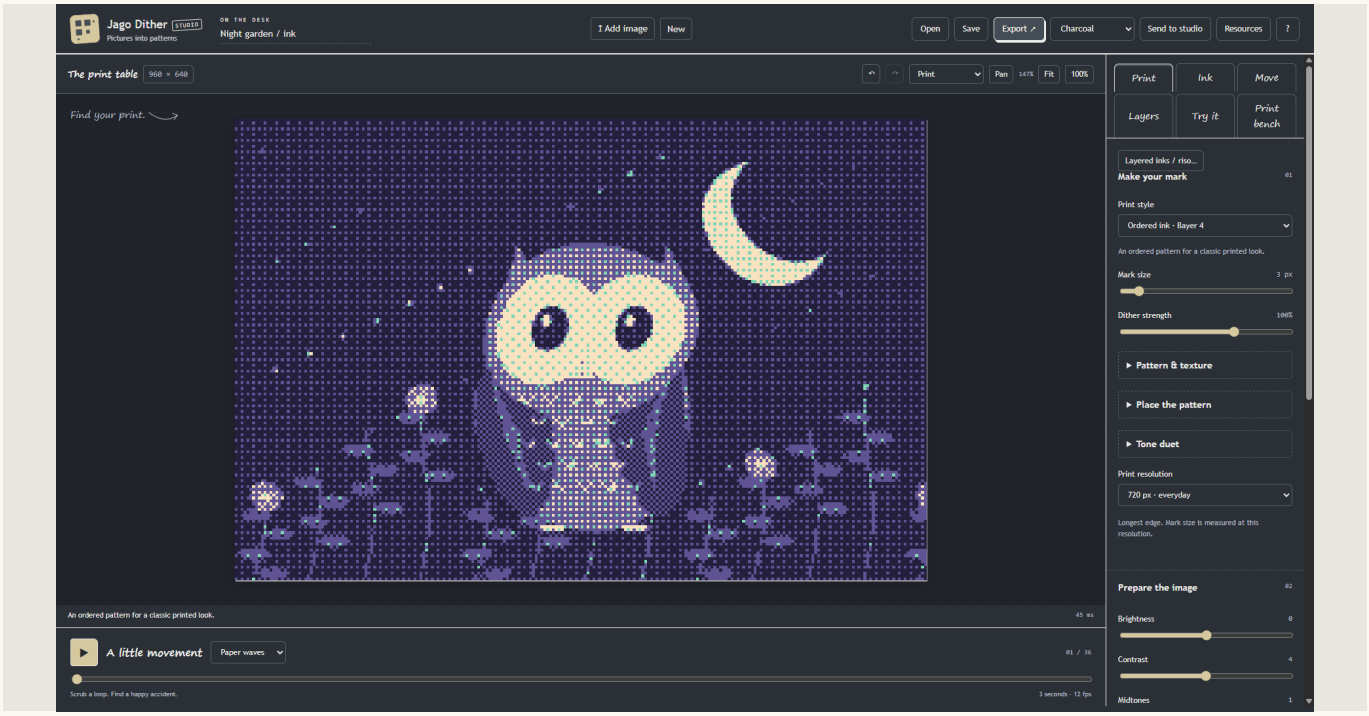

A good place to begin

Turn artwork into printed textures, limited-colour images and animated dithering. Free, local and editable.

Inside this guide
Start with a small project. Explore the toolbox. Choose the right export. Take the result into another studio.

Start small. Make it yours.

1. Bring in artwork

Use Add image or start with text, gradients and other source layers.

2. Find the print

Choose a method in Print, then adjust mark size, strength and resolution. Compare several treatments of the same image.

3. Choose your colours

Open Ink to choose a palette. Print bench gives you layered inks; use the individual toggles or bypass the ink stack when needed.

4. Make a useful export

Save the project and export a PNG or a loop. Use plate or palette exports when the next step needs them.

Your toolbox

Find your print

Explore error diffusion, ordered Bayer patterns, threshold, character art and patterned marks.

Try grain, dots, lines, crosshatching, rings, diamonds, weave and custom threshold tiles.

Adjust brightness, contrast, gamma, saturation, edges, diffusion and mark placement.

Tone duet combines two textures across the tones of one image.

Gradient maps recolour the artwork before printing; palette extraction helps find colours already in your picture.

Optional selective colour treatment works in two directions: treat selected colours, or protect them and treat everything else. Tolerance and source/palette choices refine the result.

Mix your inks

Build a limited palette with editable colours, or start from an ink set.

Print bench layers translucent inks over paper, with individual density, screen, spacing and registration settings.

Switch an ink on or off directly, or bypass the layered ink treatment altogether.

Square, diamond and ring screens join the other layered-print screen options.

Compare print directions previews several treatments of your own artwork before you choose one.

Palette files and recipes let you reuse a direction without replacing the source artwork.

A print that moves

Combine whole-print motion with animated texture.

Layer images, editable lettering, gradients, imported frame sequences and atmospheric overlays.

Stars, sparkles, lights and dust can twinkle, pulse or drift, either before the print treatment or above it.

Distress and effects include colour separation, scanlines, tape slip and block shuffle.

Compare original and printed artwork with a draggable divider, a side-by-side export or an animated reveal.

A useful print kit

Export individual black alpha coverage plates, a colour proof and reusable settings.

Add trap/spread and registration marks, choose whether paper uses the lightest ink, and inspect an offset registration proof.

Import and export GPL, JSON and plain hex palettes.

Bring a Wobble loop into Dither, or return rendered ink artwork to Wobble for further drawing.

Take it further.

Save the editable source

Your native project keeps the studio-specific editing information. Save it before making finished exports or passing a rendered result to another tool.

Export options

Editable .jagodither projects
Reusable .ditherrecipe settings
PNG stills and comparison artwork
Animated GIF
PNG frame sequences
Ink coverage plates, proofs and recipes
GPL, JSON and hex palettes
Character-grid text
Wobble project transfers

Wobble

Continue with a printed still or timed frame sequence.

Repeat

Build a pattern from a printed motif or texture.

Library

Prepare poster layouts and organise PNGs, palettes or plate proofs.

Useful things to know.

Print plates are creative RGB separations, not calibrated CMYK proofing. Confirm requirements with your printer.

GIF has hard transparency; PNG retains soft transparency.

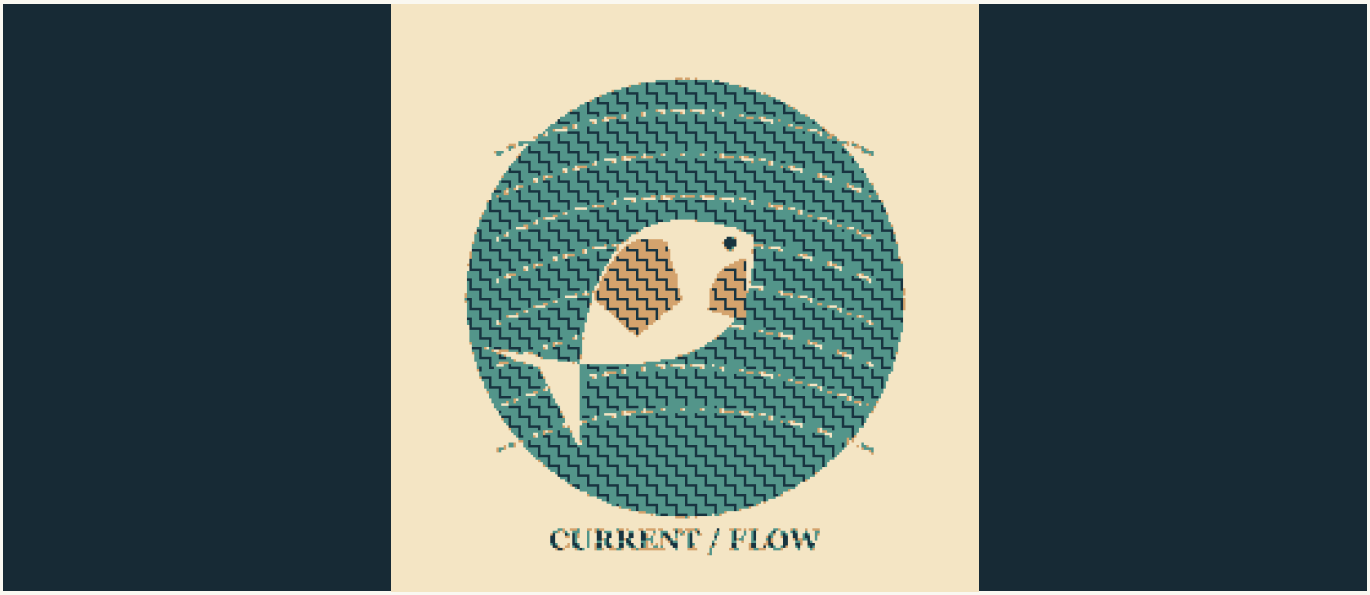

Do not promise general animated GIF or video import from the older page. Supported still-image and Jago frame-sequence workflows are the safe claims.

Rendered transfers are not a lossless round trip of every editable source layer.

Open it again

Download the ZIP and choose Extract All. Open Jago-Dither.exe from the extracted folder. For offline browser use, open Jago-Dither.html. Workscape is a Windows companion. Keep native support folders with their Windows app.

Personal, professional and commercial use are welcome. The apps are open source and free forever. Check the rights of any fonts, images, scores or other assets you import.

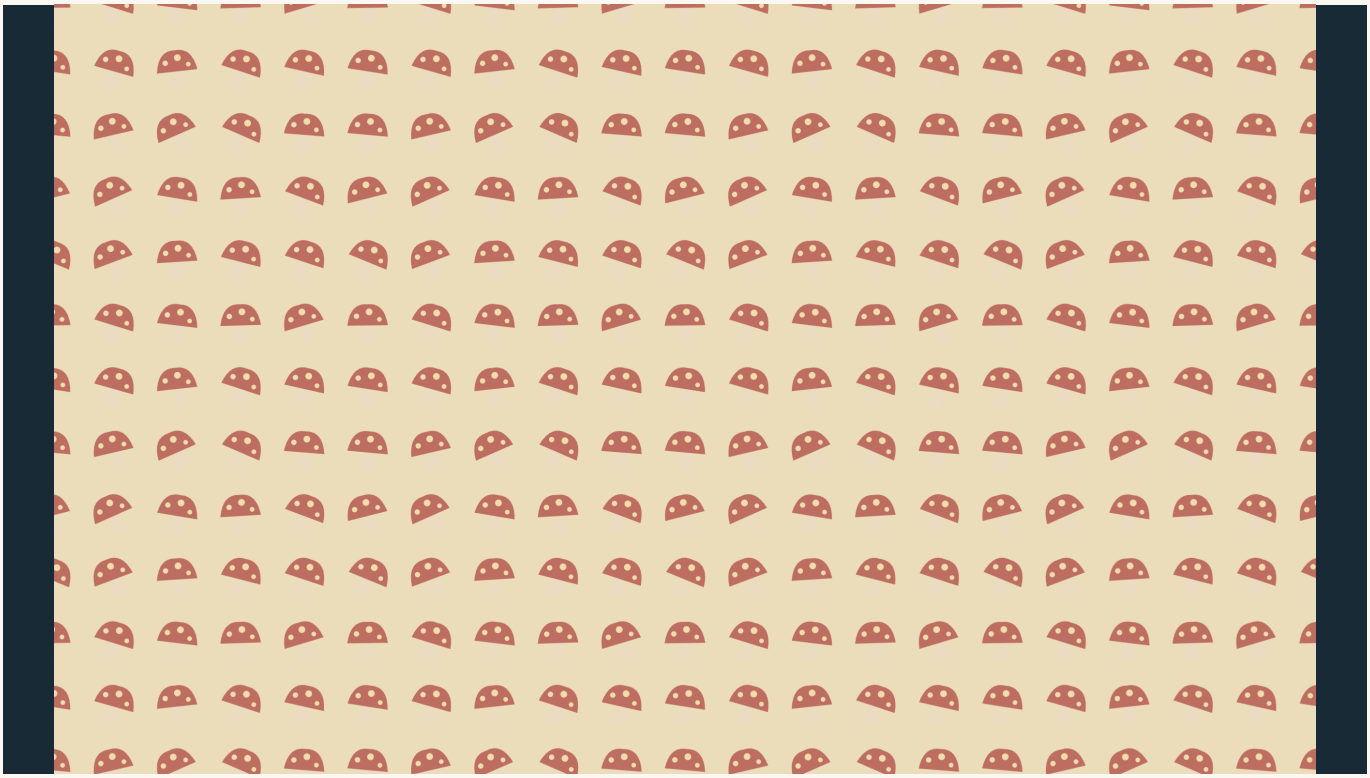

Another direction to explore with Jago Dither.

Jago Repeat

Make something that carries on.

A little motif can become a whole world of pattern. Jago Repeat helps you arrange artwork into repeats, work on texture seams and make strips that keep on scrolling.

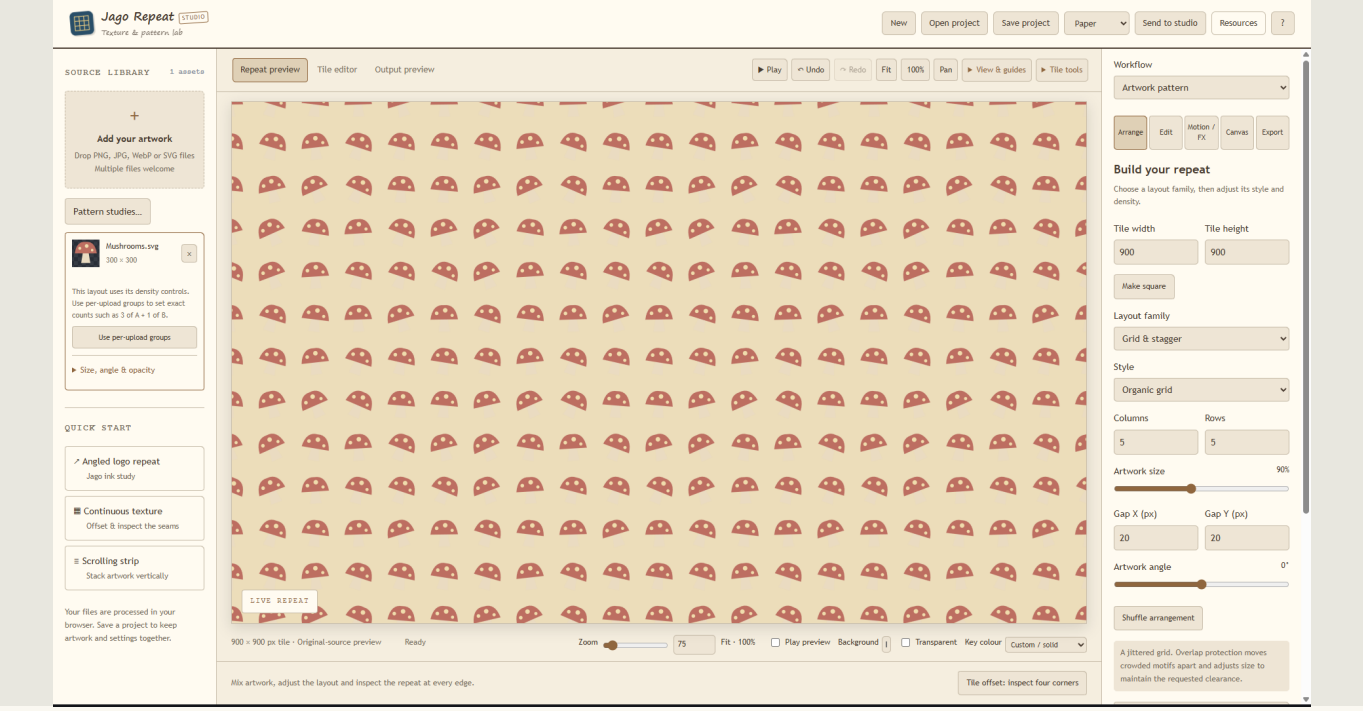

A good place to begin

Build seamless artwork patterns, paint repeating textures and make scrolling strips. Free and editable.

Inside this guide
Start with a small project. Explore the toolbox. Choose the right export. Take the result into another studio.

Start small. Make it yours.

1. Add a motif

Bring in an illustration, a vector shape or a texture. Start in artwork pattern mode for individual motifs.

2. Arrange the repeat

Pick a layout, tile size and motif scale. Add other assets and explore variation without losing the current composition.

3. Check every edge

Use the repeat proof. For a continuous texture, offset the tile and use wrapped paint or clone to repair visible seams.

4. Deliver the tile

Export a repeat tile or a tile kit. Save the project for its assets and manual placements; save a recipe when you only need the layout settings.

Your toolbox

Three ways to repeat

Artwork pattern arranges motifs; Continuous texture works with a repeating surface; Scrolling strip builds a moving feed of artwork and text.

Layouts include grids, brick and half-drop arrangements, staggered and diagonal directions, scatter, mirrors and free composition.

Adjust tile dimensions, gaps, sizes, rotation and controlled variation.

Choose linked or mirrored sets, mix sources and use overlap protection when helpful.

Freeze a generated arrangement to move, resize and rotate individual occurrences.

Explore a few directions

Preview six seeded variations using your own sources.

Lock layout, density, sizes, angles, position variation or mixing while exploring other choices.

Independent seeds let different aspects change separately.

Save a .repeatrecipe to reuse generated layout settings with different artwork.

Opening an editable pattern study or applying a variation supports Undo.

Work across the seam

Inspect a 3 × 3 repeat, offset the tile and compare opposite edges.

Paint, erase or clone directly on a raster texture with strokes wrapping across the boundaries.

Choose a repair band and export a repaired copy while keeping the original.

Export a repeat proof and tile kit for checking the result outside the studio.

From pattern to surface

Send a tile to Material as a repeating surface or a fill inside selected artwork.

Send it to World as a repeating map texture, with adjustable scale, rotation and offset in the map builder.

Export one tile, fill a larger canvas, or use the loop exporters for moving artwork.

Take it further.

Save the editable source

Your native project keeps the studio-specific editing information. Save it before making finished exports or passing a rendered result to another tool.

Export options

Editable .jagorepeat projects
Reusable .repeatrecipe layout settings
PNG, JPEG and WebP artwork
SVG with vector artwork preserved where applicable
GIF, video and PNG-sequence loop exports
Tile kits containing a tile, repeat proof, manifest and optional recipe/project

Material

Use the exported tile as a repeated surface or fill.

World

Import a tile as a map texture, with scale, angle and offset controls.

Library

Build stationery, packaging or a pattern proof sheet.

Useful things to know.

Seam repair blends edge strips and can soften detail. Inspect the proof.

A recipe stores generated layout settings, not artwork or manual placements; save a project for the exact composition.

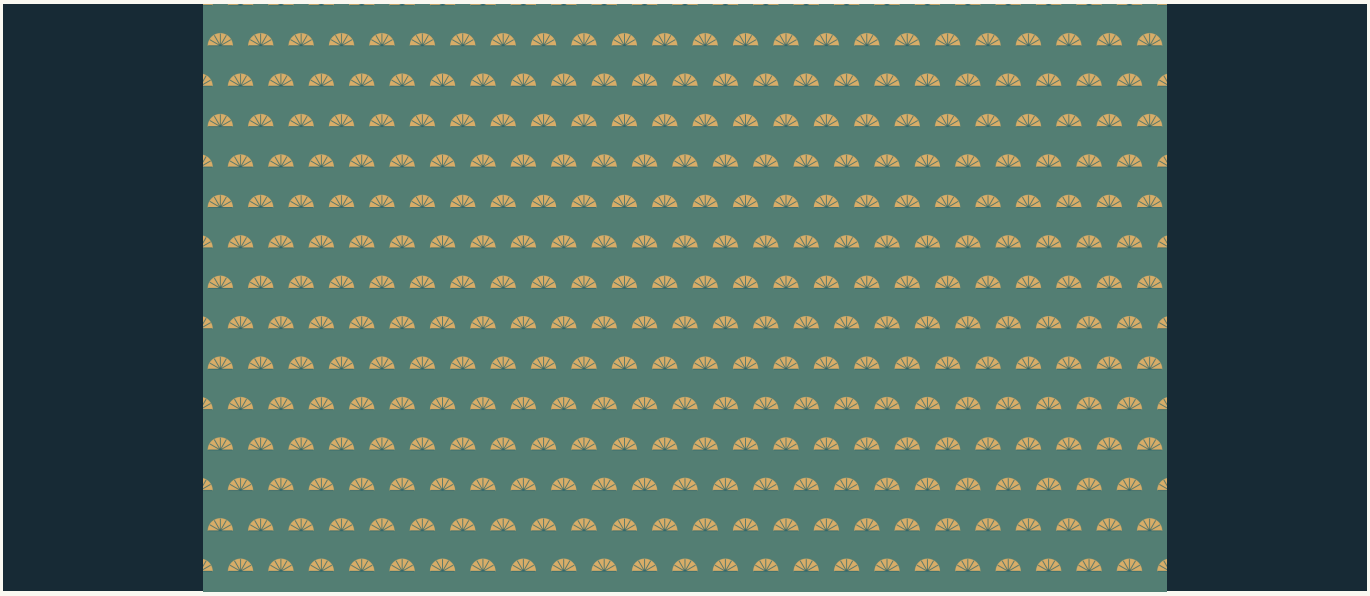

Raster sources stay raster inside SVG. Enlarging a photograph does not invent detail.

Still tile kits capture phase zero; use loop exporters for motion.

Open it again

Download the ZIP and choose Extract All. Open Jago-Repeat.exe from the extracted folder. For offline browser use, open Jago-Repeat.html. Workscape is a Windows companion. Keep native support folders with their Windows app.

Personal, professional and commercial use are welcome. The apps are open source and free forever. Check the rights of any fonts, images, scores or other assets you import.

Another direction to explore with Jago Repeat.

Jago World

Give your world somewhere to live.

Who lives here? What happened before the story began? What is on the other side of that mountain? Jago World gives the people, places and ideas of a story somewhere to live together.

A good place to begin

Connect characters, lore, maps, family trees and timelines in a free worldbuilding and writing studio.

Inside this guide
Start with a small project. Explore the toolbox. Choose the right export. Take the result into another studio.

Start small. Make it yours.

1. Start your world

Create a world, then add a character, place or faction. Link entries as the setting grows.

2. Make a map

Create a new map directly from the map workspace. Pick a blank starting state or a starter, then draw and edit its geography or site.

3. Connect the story

Add character portraits, family relationships and timeline events. Set the story present so the chronology has a clear point of view.

4. Share an intentional view

Use Explore for reading and full-screen maps. Export a map, a family tree or a reference pack for the people following your story.

Your toolbox

Keep the world connected

Build a world library of characters, places, factions, world rules and other lore, with custom entry types.

Use linked entries, relationship connections and asset references to keep ideas together.

Write scenes and reference documents at the writing desk.

Place events on a timeline and choose the story's present.

Genre starting points provide prompts and settings that can be changed or removed.

Optional spelling checks help with ordinary prose while leaving you free to use invented names.

Put it on a map

Start with blank land, ocean, space or an interior, without returning to the main desk for each new map.

Generate editable geography, settlements, sites and interior starting layouts, then refine them with the manual tools.

Draw and edit shapes, land, regions, routes, rivers, symbols and labels.

Build room layouts, fortified sites, ships and space-station layouts with the map construction tools.

Resize selections freely or keep their proportions; rotate and arrange elements.

Use atmosphere, local detail, overlays, frames, markers, legends and scale bars to finish a map.

Import Material or Repeat colour tiles as repeating land, water, wood, stone, forest, sand or paper surfaces. Adjust tile width, rotation and offsets.

Meet the family

Give characters an editable illustrated avatar or import and crop your own portrait.

Portraits follow characters into entries, reading views, sheets and family trees.

Connect parents, children, partners, adoptive and chosen-family relationships, or succession links.

Focus on a person, ancestors, descendants or connected relatives; fold branches and search the tree.

Create Storybook, Archive, Cinematic or Blueprint family presentations with portraits/cards, headings, dates and a relationship key.

Explore the story

Explore world offers a dedicated reading view for scenes, entries, maps and linked lore.

Fullscreen maps support zoom, pan and entry links.

Use generated names and emblem tools as starting points for your own editable world details.

Export a readable world bible or a reference bundle when you want to share the setting.

Take it further.

Save the editable source

Your native project keeps the studio-specific editing information. Save it before making finished exports or passing a rendered result to another tool.

Export options

Editable .jagoworld projects
World-bible Markdown
Readable HTML references
Structured JSON world data
Reference ZIP bundles with text, maps and assets
Map PNG, SVG and map data
Styled family-tree PNG and SVG
Portrait PNG and SVG

Material / Repeat

Bring repeat tiles into map roles such as land, water, floor or stone.

Sound

Attach a soundtrack or ambience for a world/project preview.

Library

Collect maps, family-tree exports and reference artwork into a project library.

Useful things to know.

Map generation is artistic, not tectonic, hydrological or architectural simulation.

Complex family relationships can still produce crossing connections.

Public exports can omit dedicated private fields, but secrets written in ordinary prose require your review.

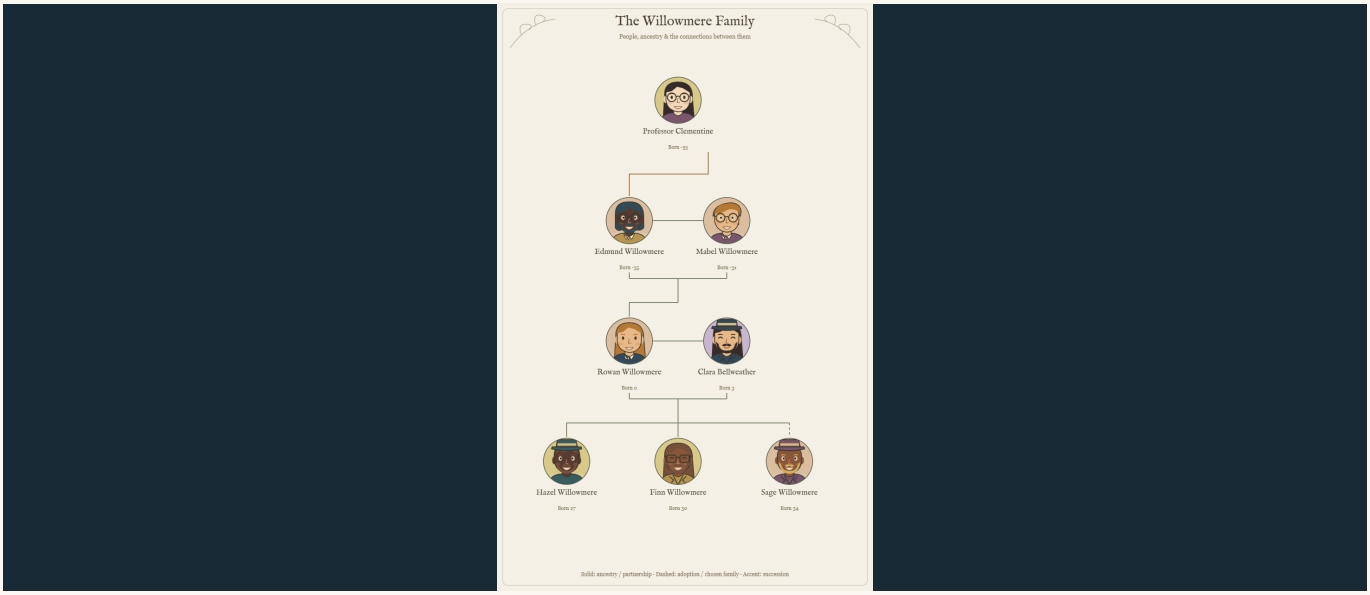

Spellchecking depends on the browser/Windows engine; it is not a custom grammar or fantasy-name dictionary.

Incoming colour tiles are surfaces, not automatically interpreted physical height maps.

Open it again

Download the ZIP and choose Extract All. Open Jago-World.exe from the extracted folder. For offline browser use, open Jago-World.html. Workscape is a Windows companion. Keep native support folders with their Windows app.

Personal, professional and commercial use are welcome. The apps are open source and free forever. Check the rights of any fonts, images, scores or other assets you import.

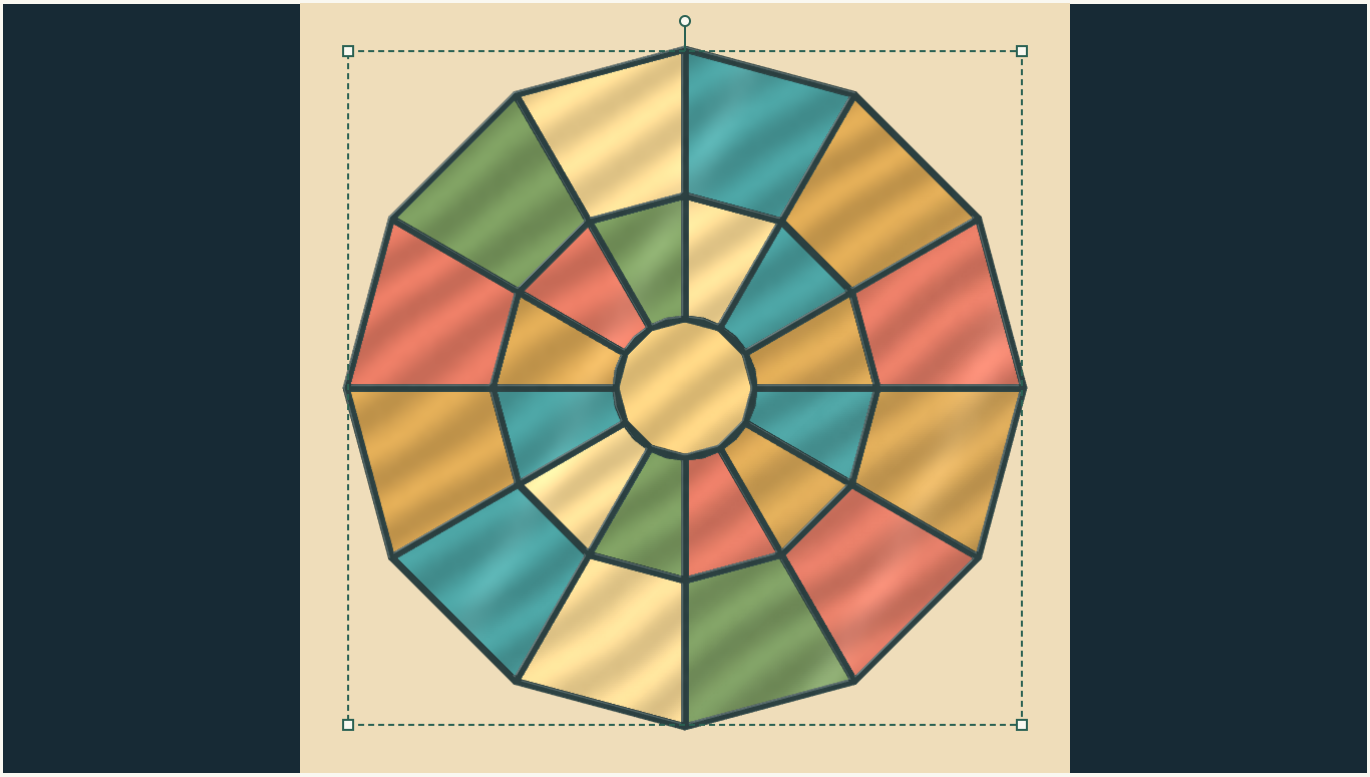

Another direction to explore with Jago World.

Jago Material

Make artwork from surfaces.

Some artwork wants to feel like something. Cut it from timber, build it from glass panes, wear it down or give it a little broken gold leaf. Jago Material is a craft bench for pictures made from surfaces.

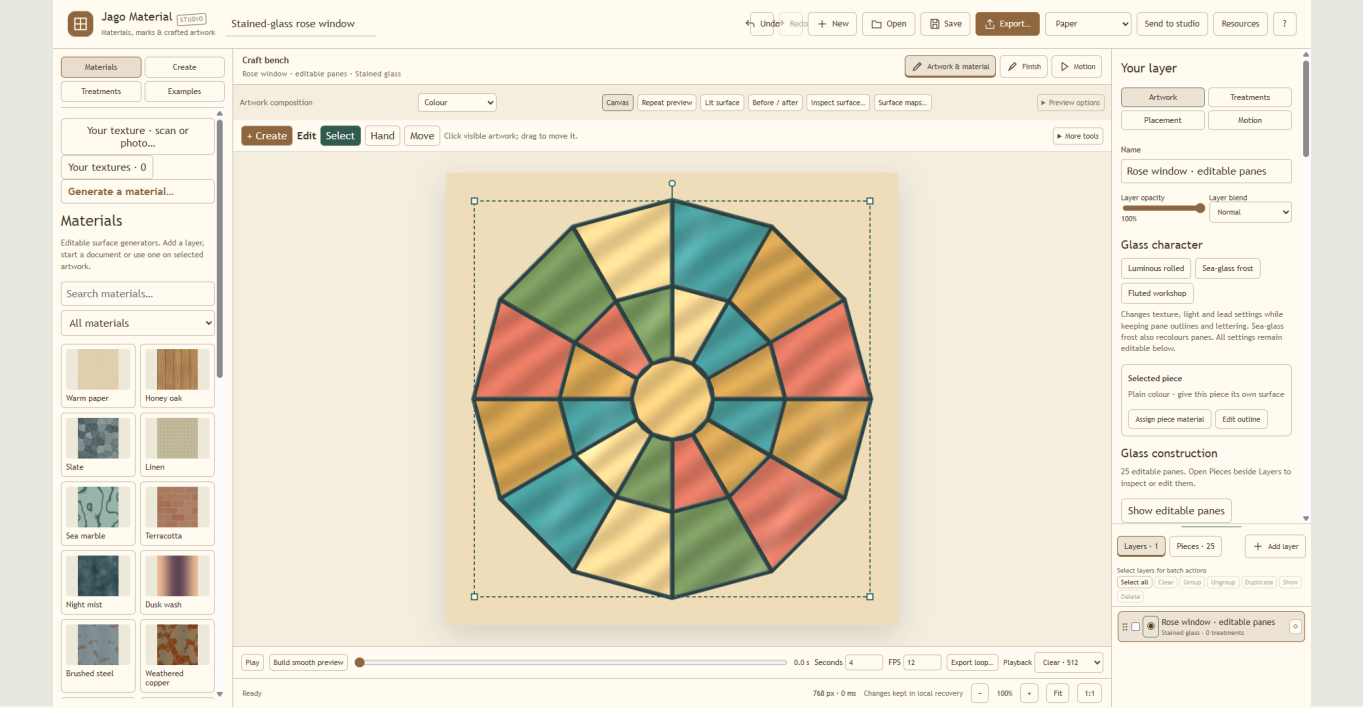

A good place to begin

Make wood, glass, metal and textured artwork, with editable shapes, lettering, finishes and surface maps.

Inside this guide
Start with a small project. Explore the toolbox. Choose the right export. Take the result into another studio.

Start small. Make it yours.

1. Start from your own idea

Choose New and a blank document. Create a shape, closed pen path or text, or import an image.

2. Build the surface

Choose a material for the selected artwork. Use Layers for the composition and Pieces for the parts inside a constructed material.

3. Finish locally

Stack treatments and tune their coverage, opacity and blend. Paint a burn, stain or wear where it belongs rather than covering every part equally.

4. Export what the next tool needs

Export transparent artwork, a repeatable texture, a surface-map kit or timed loop frames. Keep the editable project alongside the result.

Your toolbox

Build the artwork

Create from a blank document, a shape, a path, text, an image or an editable craft study.

Work with separate layers, construction pieces and source artwork.

Material lettering keeps the words, font and surface recipe editable.

Glass lettering builds pane construction and lead outlines; a simple glass fill is a different workflow.

Explore wood, glass, metal and other patterned or textured surfaces with editable colour, style and recipe settings.

Work a finish into it

Stack treatments and control their amounts and coverage.

Preview a finish before applying it to a whole layer, a construction piece or an area you paint.

Finish recipes include waxed and scorched timber, broken gold leaf, copper patina, worn iron, handled metal, rippled glass, absorbed colour and glaze.

Fine wood fibres, metal pores/oxide and glass ripple/seeds contribute to colour and surface channels.

Compare the source, treated artwork and estimated height, roughness and metallic response.

Your own texture belongs here

Import a PNG, JPEG or WebP scan/photo as a surface layer, or use it inside selected artwork.

Control repetition, proportions, rotation and offsets independently of the artwork's placement.

Set roughness and metallic response; opt into brightness relief or supply your own height, roughness and metallic maps.

Save a prepared surface to Your textures or export a portable .jagotexture file.

Use Repeat preview and tile inspection to check seams, or take the tile into Repeat for further work.

Explore and export

Surprise me explores material families, palettes and styles with editable seeded candidates and destination choices.

Use motion and distortion tools for moving surface artwork, then export through the available visual exporters.

Pan with middle mouse or Space, zoom around the pointer and reset with Fit.

Send a colour tile to World as a repeating map surface.

Export technical surface maps for another creative tool, keeping their channel roles explicit.

Take it further.

Save the editable source

Your native project keeps the studio-specific editing information. Save it before making finished exports or passing a rendered result to another tool.

Export options

Editable .jagomaterial projects and material presets
Portable .jagotexture prepared surfaces
PNG colour artwork, transparent selected layers and repeat sheets
PNG frame-sequence loop ZIPs with timing metadata and the editable project
Surface-map ZIP: colour, height, roughness, metallic, normal, ORM and opacity PNGs
OpenGL or DirectX normal choices
Tile proofs and repaired copies
Editable original project included in surface packs

World

Use a rendered repeatable material as a map texture.

Repeat

Inspect and arrange the material as a seamless repeat tile.

Wobble

Bring in animation or send a timed rendered sequence onward.

Library

Place surface artwork into a layout or keep texture kits organised.

Useful things to know.

Surface maps are artist-authored estimates, not physically measured scans.

Lighting is a preview, not a full physically based renderer or realistic glass refraction.

A photograph's dark areas are not automatically dents; brightness relief is optional.

ORM uses neutral occlusion, not measured ambient occlusion.

Surface-map export captures time zero. Repairing one preview channel does not repair every channel automatically.

Open it again

Download the ZIP and choose Extract All. Open Jago-Material.exe from the extracted folder. For offline browser use, open Jago-Material.html. Workscape is a Windows companion. Keep native support folders with their Windows app.

Personal, professional and commercial use are welcome. The apps are open source and free forever. Check the rights of any fonts, images, scores or other assets you import.

Another direction to explore with Jago Material.

Jago Sound

A little spark. A sound of your own.

Make a tune from a feeling, a little sound for a game, or an atmosphere for a scene. Jago Sound helps you begin without music theory and gives you editable notes and sound ingredients when you want to go further.

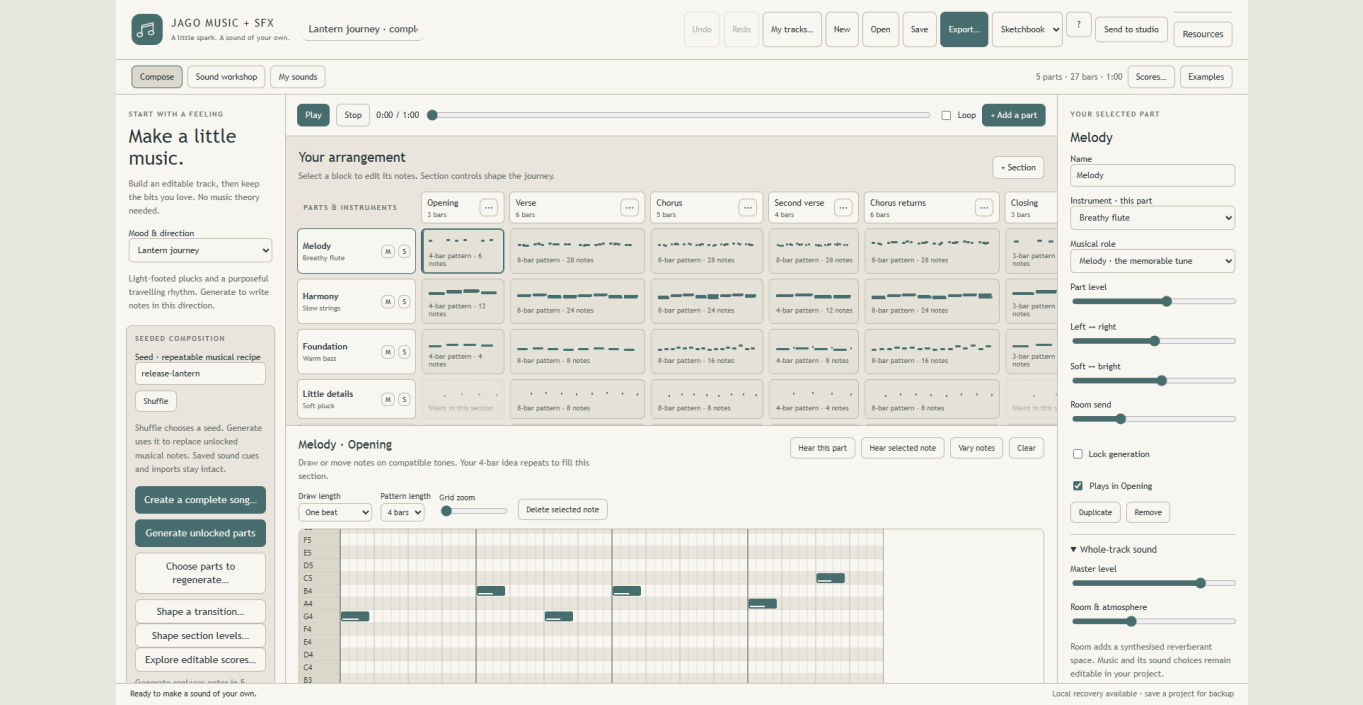

A good place to begin

Make music, effects and ambience your way. Editable songs, seeded ideas and a sound workshop that starts from scratch.

Inside this guide
Start with a small project. Explore the toolbox. Choose the right export. Take the result into another studio.

Start small. Make it yours.

1. Choose your direction

Create a complete song: pick a feeling, approach, length and complete-song or loop ending. Any approach explores all four families; compare three ideas before choosing.

2. Edit and listen

Draw and reshape notes, choose instruments and shape section levels. Hear selected note auditions a placed note or drum hit; Hear this part previews the whole part.

3. Build a sound

Create from scratch adds tone, noise, impact or recording ingredients. Draw curves; move timing bars or resize either end. Preview can keep playing while you edit.

4. Keep the good work

My tracks stores compositions locally. My sounds folders belong to the current track. Create a folder with an explicit parent, then move saved work into it. Export WAV and keep the project too.

Your toolbox

Find your musical direction

Choose a feeling, pace, instrument palette, approximate length and a complete song or loop.

Explore Jago original, Arrangement-led, Groove-led and Motif-led, or let Any approach choose a family.

Surprise me explores unlocked settings and changes an unlocked song shape. Optional variable length explores 15-180 seconds.

Tune drum feel and strength, bass movement, melody, harmony, little details and phrase development.

Explore three alternatives: audition them before choosing one; your current composition stays in place until you use an idea.

Seeds and settings stay with the saved project. Regenerate selected or unlocked parts while preserving locked parts.

Compose and refine

Add musical parts and sections, draw ordinary notes, then move, resize or delete them with undo.

Hear selected note auditions an existing note, drum hit or clip beside Hear this part.

Adjust instrument, volume, pan, brightness and space; section levels shape the arrangement.

Generate or change instruments during playback; prepared changes queue while you keep listening.

Import recorded audio, trim its use and place it in the arrangement.

Build a sound of your own

Create from scratch starts with an empty sound, not a required preset.

Combine up to eight tone, noise, impact or recording ingredients.

Draw each ingredient's volume curve and, where applicable, pitch curve; control filtering, roughness, level and stereo position.

Drag a timing bar to move it, or either end handle to resize it. Live readouts show start, end and length.

Invent seeded sounds from signal, impact, air and rising families; keep fresh results separately on your shelf.

Four editable sound studies reveal their ingredients, curves and timing.

Useful effects and ambience

Explore rain, wind, ocean, footsteps, ember snaps, campfire, room tone, thunder, engines, drones and contact sounds.

Keep preview running as settings change. The Loop choice follows the recipe in preview and WAV export.

My sounds stores named recipes, favourites and project folders. Export names follow the sound you are editing.

Keep your work organised

My tracks saves complete compositions locally and lets you switch between them.

Create folders and subfolders with an explicit parent picker, then move saved tracks without opening them.

My sounds folders belong to the current track; save or export its project to keep those sounds together.

Your toolbox, continued

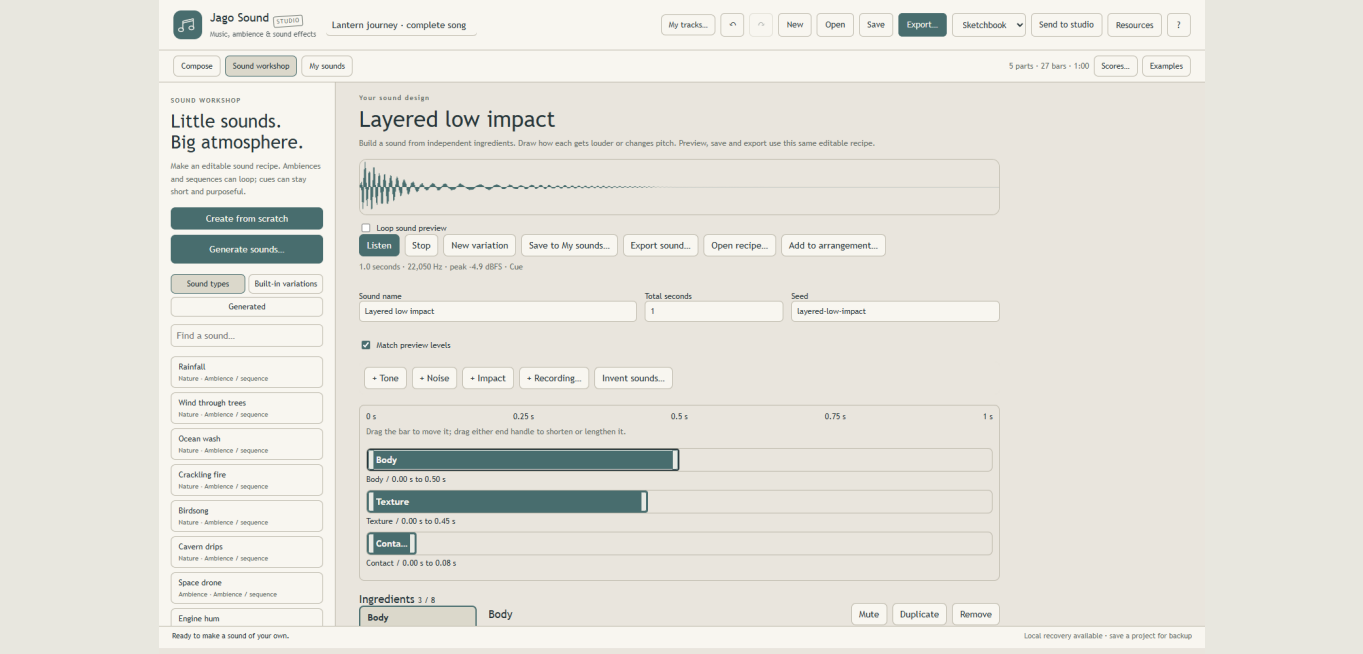

Scores and connected projects

Explore Joplin, Satie, Chopin and Vivaldi examples, or import supported MIDI.

Choose a passage or the full supported score, choose parts and edit the result.

Library can send supported MIDI into the score importer.

Send a rendered sound or arrangement to World and other supported studio projects for playback; include the original when you want to retain the Sound project.

From an empty recipe to a sound. Add ingredients, choose one to edit, then draw its volume or pitch curve. Drag its timing bar to move it, or use either end handle to change its length. Each gesture can be undone.

Take it further.

Save the editable source

Your native project keeps the studio-specific editing information. Save it before making finished exports or passing a rendered result to another tool.

Export options

Editable .jagomusic projects
Stereo WAV mixes and sound effects; stem/export-kit options
MIDI note arrangements
Editable .jagosound recipes and WAV + recipe ZIP
Compact WAV studio transfers, with optional original project

Library

Send supported MIDI into Sound. Keep exported tracks, sound effects and project backups with your other assets.

World

Send a sound or arrangement as a Project audio attachment. Play it with its own controls; it does not automatically follow maps or characters.

Stereo masters

Direct handoff uses compact 22.05 kHz mono WAV. Export stereo WAV and attach it separately when that quality matters.

Video editor

Export your audio and visual sequence separately, then combine them in the editor of your choice.

Useful things to know.

Tracks are bounded to three minutes; the editor is intended for compact compositions, cues and loops.

Custom sounds use up to eight ingredients and 30 seconds. Imported ingredient recordings are limited to 6 MB and 30 seconds.

MIDI import supports bounded beat-based format 0/1 scores. Changing tempi, metre and expressive controllers have limitations.

Built-in effects are procedural interpretations; your imported recordings retain their own usage rights.

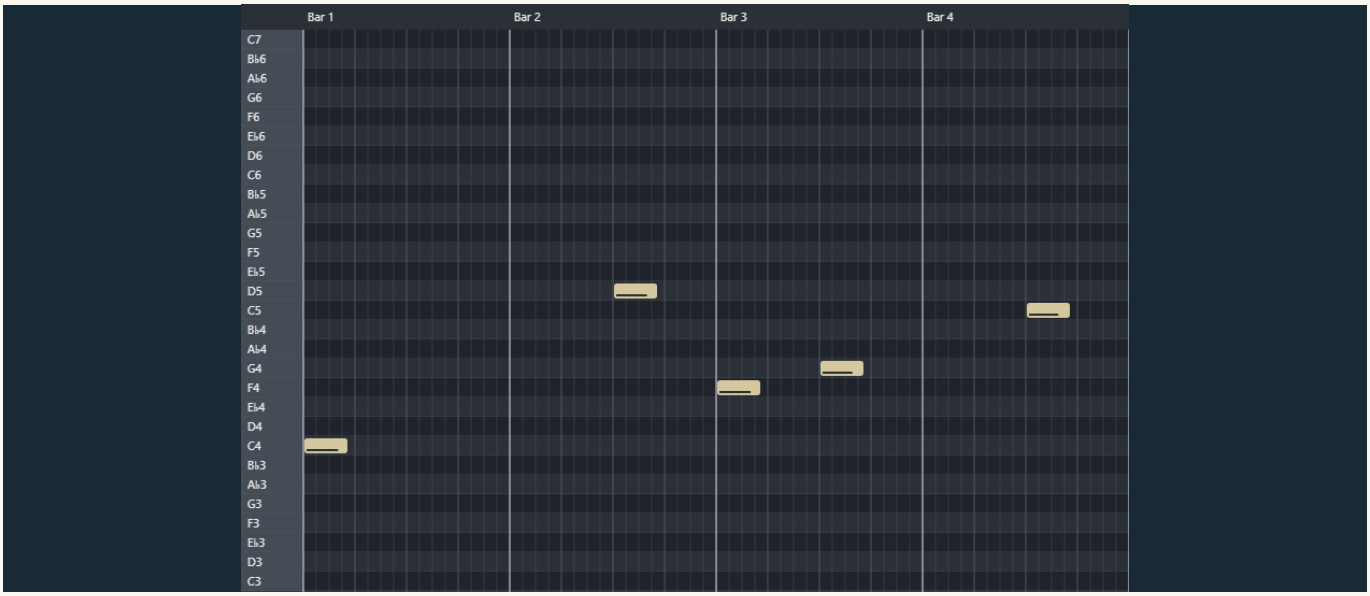

The Vivaldi score edition is CC BY-SA 3.0; its derivatives require the applicable credit and licence. The three bundled piano editions are public domain.

Direct studio transfer carries compact 22.05 kHz mono WAV. Use normal stereo WAV export for a master. World attachments support project playback; they are not automatically tied to maps or baked into image exports.

Open it again

Download the ZIP and choose Extract All. Open Jago-Sound.exe from the extracted folder. For offline browser use, open Jago-Sound.html. Workscape is a Windows companion. Keep native support folders with their Windows app.

Personal, professional and commercial use are welcome. The apps are open source and free forever. Check the rights of any fonts, images, scores or other assets you import.

Another direction to explore with Jago Sound.

Jago Library

A home for your creative files.

The right file is probably somewhere. Jago Library helps you bring scattered creative assets into view, try fonts properly and turn a useful find into something you can share.

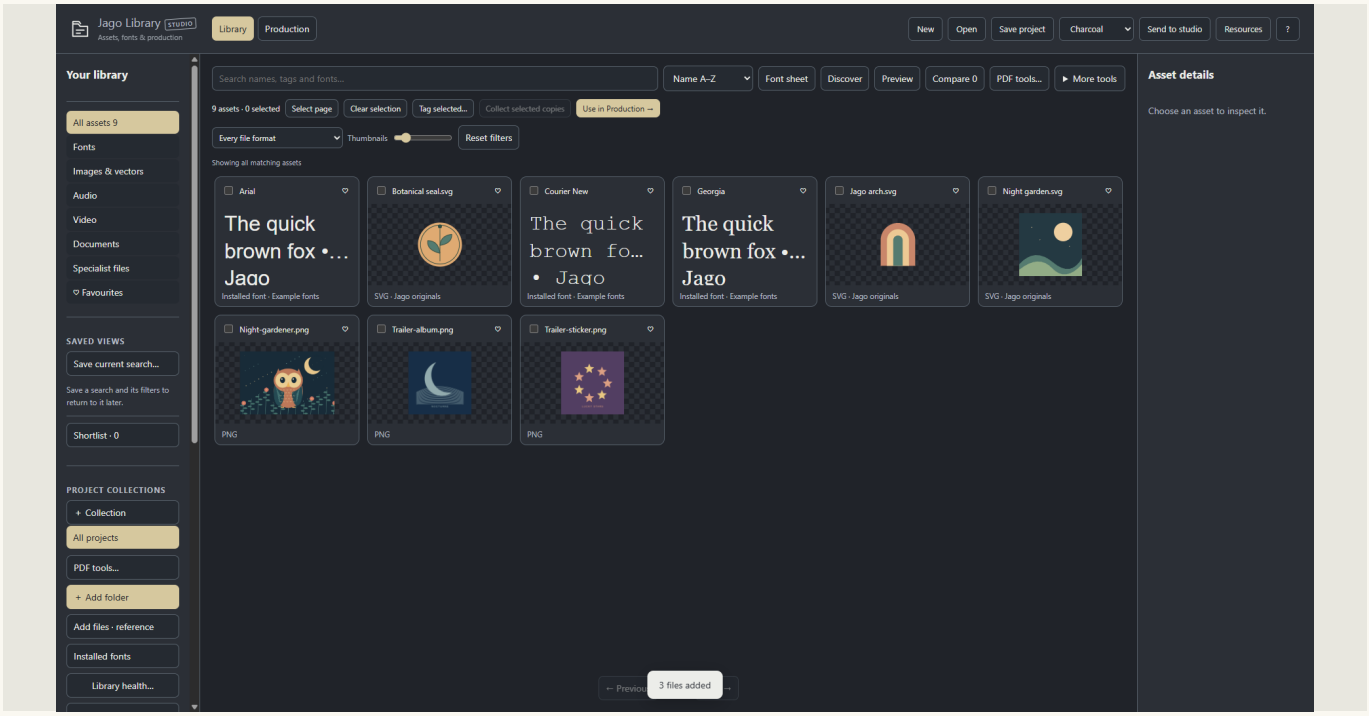

A good place to begin

Browse assets and fonts, organise collections, build layouts and work with PDFs. A free creative library.

Inside this guide
Start with a small project. Explore the toolbox. Choose the right export. Take the result into another studio.

Start small. Make it yours.

1. Bring your files together

Add folders or files. Use filters, favourites, tags and collections to find useful assets; collect copies into a managed library when you want them in one place.

2. Explore the fonts

Preview your own words, inspect glyphs and compare favourites. Adding a font to the Jago pool is separate from installing it in Windows.

3. Make a layout

Start a new production design or a template. Add artwork through the asset browser, then crop, mask, rotate, align and layer it with text and shapes.

4. Open a PDF

Select or open a PDF to reach the reader. PDF tools & export gathers page organisation, extraction, conversion and the native Windows options.

Your toolbox

Find the good stuff

Add files and folders, filter by type/extension, tag assets and mark favourites.

Use larger thumbnails, full previews, a shortlist and comparison of two to four assets.

Saved views remember searches and filters; nested project collections organise references.

Collect copies from scattered drives into a chosen Library home.

Library health checks missing references and byte-identical duplicates; source, creator and licence notes stay with assets.

Text and bounded Office previews help identify documents; supported embedded previews make some specialist artwork formats viewable.

Give fonts a proper look

Enter your own words, adjust the preview and inspect glyphs.

Filter using origin, variable/static and category metadata where available; favourite useful fonts.

Send your current words as transparent PNG artwork to another studio.

Include an available library font file with the specimen, or add it to the persistent Jago font pool.

Install TTF/OTF fonts for your Windows user. Manage supported user-installed fonts with removal backups and restore; machine/system fonts remain in Windows settings.

Make something in Production

Start a new design or an editable template for brand displays, social artwork, thumbnails or website-style mockups.

Add text, artwork and editable shapes, including triangles, hexagons and stars.

Choose Library artwork without leaving Production. Drag artwork into a shape or use its artwork mask.

Edit the contents inside an image frame, keeping the original source intact.

Move, resize, rotate, group, align, distribute, snap, lock and reorder layers, with Undo/Redo.

Video assets can supply a chosen still frame for a design.

Batch preparation resizes, trims, pads and fits/crops image sets; recipes keep useful settings.

A practical PDF desk

Read PDFs, navigate thumbnails/pages, zoom, select/copy text and find matching text.

Combine, split, reorder, duplicate, rotate, remove and crop pages with Undo.

Export page images, text/data, multi-page PDFs and image/design-to-PDF.

Convert to Word using offline reconstruction, editable text, readable text or appearance-preserving page images.

Offline reconstruction offers flowing editing or original-position text boxes for designed pages.

Recognise English scans locally, review text and create a searchable PDF copy.

Your toolbox, continued

Register Library as a PDF app, then choose it in Windows Default apps. Existing Jago sessions can receive opened PDFs.

Take it further.

Save the editable source

Your native project keeps the studio-specific editing information. Save it before making finished exports or passing a rendered result to another tool.

Export options

Editable .jagolibrary catalogs and production designs
PNG, JPEG and WebP artwork
SVG text/shapes with rendered image layers
Single or multi-page PDF
Artwork kits with rendered output, project and manifest
Sprite sheets with JSON manifests
Batch-preparation image sets and recipes
PDF-to-DOCX
PDF page images and split-page ZIPs
Plain text, HTML, detected-cell CSV and geometry JSON

Sound

Send supported MIDI or audio to the relevant musical/sound workflow.

Material / Repeat

Send textures or artwork as the source for a surface or tile.

Dither / Wobble

Send rendered text samples or images. The Jago font pool also makes approved fonts available across the suite.

Useful things to know.

Windows font management, native folder access and bundled PDF/OCR engines belong to the Windows edition.

Unusual file previews depend on embedded previews and supported readers; do not promise every .ai, .affinity or other proprietary file will render.

Office previews show bounded content, not exact Word/Excel/PowerPoint rendering.

Production uses selected video stills; it is not a video editor.

PDF-to-Word and OCR can need cleanup. Preserve appearance uses images, not editable text.

PDF cropping is not redaction; detected-cell CSV is not guaranteed table reconstruction.

Collections organise references; external files must remain available unless collected/embedded.

Open it again

Download the ZIP and choose Extract All. Open Jago-Library.exe from the extracted folder. For offline browser use, open Jago-Library.html. Workscape is a Windows companion. Keep native support folders with their Windows app.

Personal, professional and commercial use are welcome. The apps are open source and free forever. Check the rights of any fonts, images, scores or other assets you import.

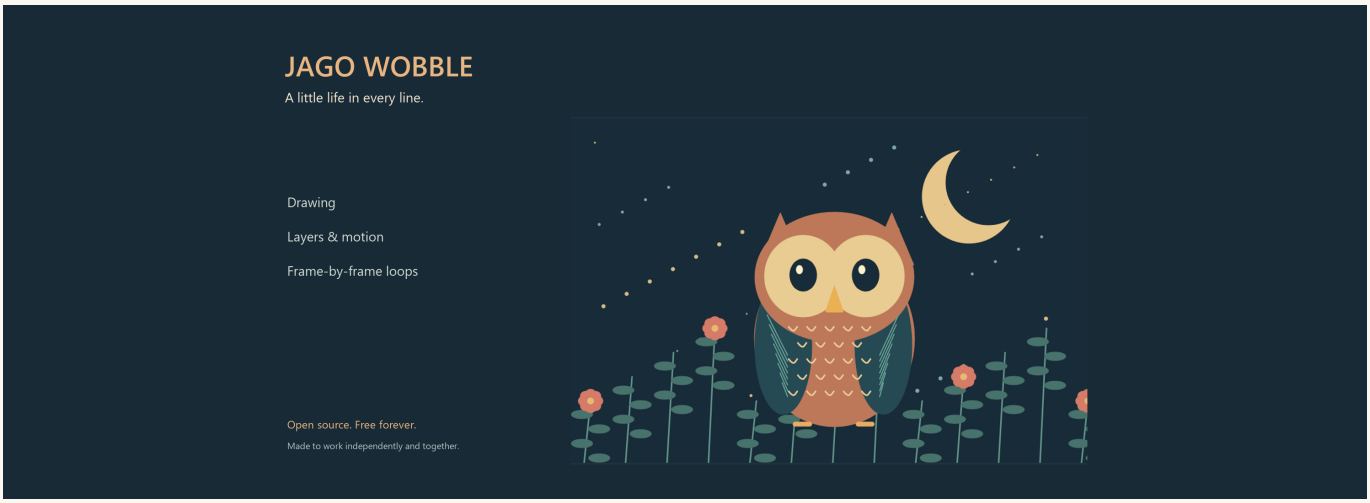

Another direction to explore with Jago Library.

A drawing can go a long way.

01 / A small drawing becomes a collection

Wobble > Dither > Repeat > Library
Draw an editable motif in Wobble. Send a PNG to Dither and choose its palette. Send the result to Repeat to arrange it into a seamless pattern. Use Library to make a poster, proof sheet or matching collection of layouts. Keep the Wobble and Repeat projects for later revisions.

02 / Give a map its own surfaces

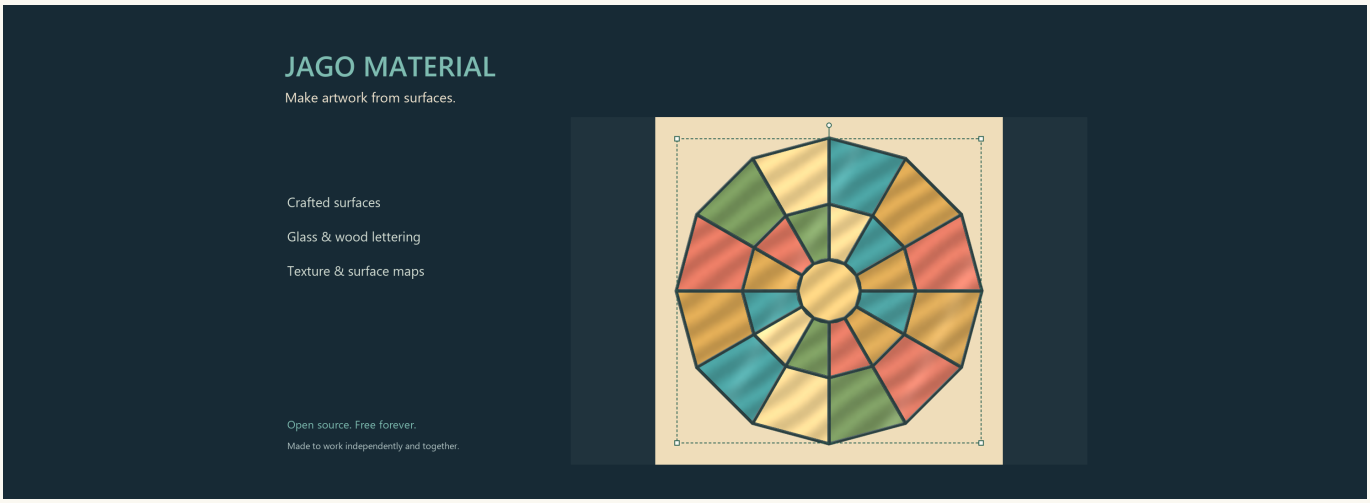

Material > Repeat > World
Make a stone, timber or water texture in Material. Check the tile in Repeat when you need a repeat proof or seam repair. In World, import the tile into the map texture role you want, then tune scale, rotation and offset. The map receives the rendered colour texture; keep the material project and surface maps separately.

Use the right kind of handoff.

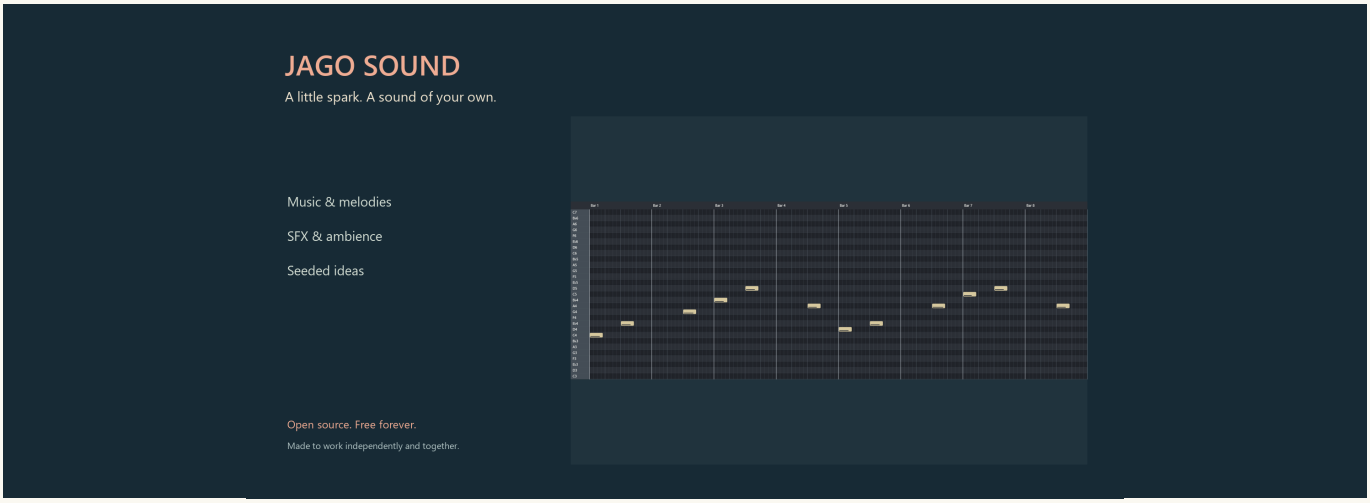

03 / A font becomes artwork

Library > Material / Dither / Wobble
Preview your chosen words in Library. Send a rendered PNG when you want exactly that artwork. Add the font to the shared Jago font pool when another studio needs editable lettering. In Material, use Glass lettering to build panes and lead; an ordinary material fill does not construct glass letters.

04 / Give the setting a soundtrack

Library > Sound > World / visual studio
Send supported MIDI from Library into Sound, or compose a new track and design ambience there. Export WAV and attach it to a supported project preview. When delivering a video, combine the audio and visual exports in your video editor.

A clear handoff.

Choose the result

Select a still, rendered loop, audio file or supported source asset in the sending studio. Check the handoff preview and import options before applying it.

Choose the destination

The native route can open a separate studio window, send into a Workscape tab or help open both studios in Workscape when available. You can use the studios independently without the companion app.

Know what stays editable

Native projects retain their source studio's editing model. A rendered PNG or audio file is a useful shared asset, but it does not reproduce every source layer, note or parameter in another app. Include the original when you need to keep it.

Let Library help

Library is useful as the browsing and organisation point for images, fonts, textures, MIDI and audio. Use its filters or production asset browser, and keep the project assets together when moving work between machines.

Keep sound separate

PNG, GIF and other visual exports are silent. Attached audio supports project preview; export the WAV separately and combine it with picture in a video editor.

A portable workspace still needs its files

A .jagoworkspace stores a working setup and studio references. Keep the required studios and document files available; it is not a replacement for the source documents or an all-assets archive.

Choose a useful file.

PNG

Finished artwork, transparency, map images and texture tiles.

JPEG / WebP

Supported compressed image delivery. Use PNG when transparency or lossless detail matters.

SVG

Vector-friendly delivery where supported. Embedded raster artwork remains raster; SVG does not turn every effect into editable vector geometry.

GIF

Small animation loops. Limited colours and hard transparency; no audio.

Timed PNG sequence

Full-colour animation frames with timing information where supported. Assemble with audio in a video editor.

Sprite sheet + JSON

Animation assets for games and other pipelines. Wobble supplies timing and optional padding, enlargement and palette choices.

WAV

Rendered music, effects and ambience. A good playback asset; editing notes still needs the Sound project.

MIDI

Musical note information. Instruments and expressive performance can sound different in another application.

Palette / print plates

Dither colour palettes and creative RGB print separations. Confirm production requirements with your printer.

Surface-map kit

Material colour, height, roughness, metallic, normal, opacity and packed maps where selected. These are artist-authored maps, with neutral ambient occlusion in ORM delivery.

PDF / DOCX

Library page assembly, reader extraction and conversion. Choose editable flow or original-position reconstruction for your document; preservation as images prioritises appearance.

Choose a useful file, continued.

Native project

The studio-specific editable source. Save this alongside the finished asset.

Files to open and keep

Open a Windows app from its extracted folder. The browser file runs offline. Save the native project when you want to continue editing.

Wobble

Editable project: .jagolibrary

Workscape

Jago-Workscape.exe | Windows companion
Working setup: .jagoworkspace

Free to make things with.

Your use

Personal, professional and commercial use of the apps and your original creations is welcome. Jago does not charge royalties or require Jago attribution for your own original output.

Imported material

Fonts, photographs, music scores, brushes and other imported assets retain their own rights. The software licence does not grant rights to somebody else's artwork or recording.

Open source

Application code is provided with its licence and source. Third-party components have their own notices; Library's bundled PDF helper includes AGPL components. Read the included licences when modifying or redistributing the software.

Included musical scores

Public-domain compositions and particular score editions are different rights questions. The included Vivaldi Summer score edition and derivatives carry CC BY-SA 3.0 credit requirements. The two new Sound demos in this showcase use original seeded studio compositions.

About these pictures

The new owl is an editable Wobble drawing built from native shapes and pen strokes. Dither prints use the actual Dither engine. Repeat patterns, Material surfaces, World maps and Library layouts were rendered in the studios. Some other Wobble studies use imported raster animation frames.

About the loops

Feature tours are paced sequences of actual interfaces. Native owl and Dither ripple loops show their rendered motion. Other backgrounds use the real artwork with presentation pans or tile scrolling; Sound backgrounds visualise the exported audio. Workscape's connections artwork is a diagram, not an application screenshot.

Versions

Suite 2.8.0. Wobble 1.8.0; Dither 1.6.0; Repeat 1.12.0; World 0.22.0; Material 0.15.0; Sound 0.8.0; Library 0.9.0; Workscape 0.5.2. No version numbers were changed for this media and documentation pack.
