

Creative tools. Connected ideas.

Jago Suite 2.9.0

Eight creative studios, an optional tabbed home and a lightweight desktop companion. Make something in one tool, then take it further in another.

Start anywhere

Draw in Wobble, print in Dither, build patterns in Repeat, explore World, craft Material, compose Sound, organise Library or choreograph Pulse. Workscape brings them together; Companion keeps notes and captures close.

Open source. Free forever. Personal, professional and commercial use are welcome. Imported assets and third-party components retain their own licences.

Find your way

Choose a studio or a connected workflow.

Jago Workscape Your studios, together. **5**

Jago Wobble A little life in every line. **9**

Jago Dither Pictures into patterns. **13**

Jago Repeat Make something that carries on. **17**

Jago World Give your ideas a world. **21**

Jago Material Make surfaces with character. **25**

Jago Sound Make a little noise. Or a whole song. **29**

Jago Library A home for your creative projects. **33**

Jago Companion Keep the little things close. **37**

Jago Pulse Art, rhythm and motion. **41**

Installation and everyday use: 3 Working across studios: 4 Formats and optional tools: 45 Keeping your work portable: 46

Each studio section includes a simple introduction, a first workflow, tools, update highlights and practical file details.

Open your creative tools

Install the tools you want

The suite installer lets you select one app or the whole collection. Optional document tools sit beneath Library; the optional English lyric engine sits beneath Pulse. Choose the install location or keep the shared per-user default. Run setup again to update, add or remove selected components.

Or keep it portable

Download Jago-Suite-v2.9.0.zip, right-click and choose Extract All. Open Jago-Workscape.exe or an app from its folder. Keep the extracted folder structure together. Individual app ZIPs work the same way without an installer.

Browser editions

Wobble, Dither, Repeat, World, Material, Sound, Library and Pulse include named HTML files for offline browser use. Workscape and Companion are Windows apps. Browser file access, local engines and codecs differ from Windows; save downloaded projects explicitly.

Windows requirements

Use 64-bit Windows with .NET Framework 4.8 and Microsoft Edge WebView2 Runtime. Media playback and encoding also depend on available codecs and hardware. Close your Jago apps, including Companion in the tray, before updating.

Your files stay yours

Program files, settings and creative files have different homes. Library folder links point to originals; a project save does not automatically copy them. Companion saves notes/captures outside its program folder. Back up your project homes as well as editable project files.

One idea, several tools

Illustration to printed pattern

Draw and animate in Wobble. Send compatible artwork to Dither for inks or export a still as a Repeat motif. Save the original drawing and finished print/pattern separately.

Texture to place

Make or scan a texture in Material. Use Repeat to inspect the seam. Send/import the colour tile into World and set its map role, repeat width, angle and offsets. Height/roughness maps remain separate references.

Music to motion

Compose and export WAV in Sound. Import it into Pulse, choose the track length and compare visual directions. Check the estimated pulse by listening, refine colour/motion, then export the film. A short rendered clip can be treated in Dither within its clip limits.

Capture to creative project

Capture and annotate with Companion. Open the capture folder or Library inbox, then add the image to a board or layout. Image OCR copies selected recognised text without changing the image.

Handoff versus file exchange

Send to studio handles supported destinations and may include the editable original. A rendered transfer is not a complete editable conversion into another studio. Pulse Use elsewhere provides files; import those through the receiving tool’s supported route.

Jago Workscape

Your studios, together.

An optional home for Jago tools. Open studio tabs, compare two views and keep a connected creative session together. Each studio can also work independently.

Your first few minutes

1. Open Workscape and choose a studio on Home.
2. Open a second studio and choose a pair to work beside it.
3. Use Send to studio inside the source studio for supported assets.
4. Save workspace before closing; also save important native studio projects.

Version 0.5.5 | Windows application

What you can do

Jago Workscape 0.5.5

- Open installed or portable studios from Home; choose an explicit app location in Manage studios.
- Work with tabs, side-by-side pairs and detached windows.
- Save editable workspace snapshots and return to recovered sessions.
- Use Companion as a full tab, an adjustable narrow panel or a floating note.
- Home shortcuts provide quick access to Capture and Board.

A useful way to work

All studios: tabs and supported working pairs.

Keep your editable project alongside finished exports. A rendered image, audio file or video preserves the result; the native project preserves the editing controls.

In this update

New tools and refinements

- Pulse joins the editable studio tabs, including embedded music, artwork and fonts in workspace saves.
- Companion reuse, sidebar and floating integration have been refined.
- Close all tabs offers a save route while detached windows remain independent.
- Studio discovery, snapshot access and native bridge handling have been strengthened.

Keep exploring

Use the editable examples and in-app help to try another direction. Save a copy before experimenting with an important project.

The controls described here are included in this version. Optional local tools are identified in the practical details; they do not run continuously.

Save, share & connect

Files you can keep

- Editable workspace saves and local recovery snapshots
- Studio output remains available inside each studio

Connected workflows

- All studios: tabs and supported working pairs.
- Companion: full tab, narrow panel and floating note.
- Capture / Board: direct Home access.

Practical details

Windows only; no HTML edition.

A workspace is a session document, not a backup of every external linked source.

Automatic adoption of an independently opened Pulse window is not guaranteed; launch Pulse through Workscape or select its supported tab route.

Opening: Extract the complete ZIP and open Jago-Workscape.exe. Keep supporting files together. The shared suite installer can install this app on its own.

Jago Wobble

A little life in every line.

Draw expressive illustrations and bring them to life with frame-by-frame animation or editable motion. Start with a blank page or an example and keep the original drawing editable.

Your first few minutes

1. Create a blank drawing or open an editable example.
2. Draw on a layer, then add or duplicate a frame.
3. Adjust holds or explore motion directions; compare before keeping one.
4. Save the .jago project, then export a still, loop or sprite sheet.

Version 1.9.0 | Windows and offline browser edition

What you can do

Jago Wobble 1.9.0

- Pens, shapes, stamp brushes, colour, opacity, pixel treatments and optional thin-stroke correction.
- Layers, editable motion and traditional frame-by-frame animation.
- Blank/duplicated frames, adjustable holds, named clips and forward/reverse/ping-pong playback.
- Onion skin with neighbouring-frame, active-layer and loop-wrap controls.
- Pointer-centred zoom, middle-mouse pan, Fit and 1:1; project audio for preview.

A useful way to work

Dither: print a still or timed drawing loop.

Keep your editable project alongside finished exports. A rendered image, audio file or video preserves the result; the native project preserves the editing controls.

In this update

New tools and refinements

- Explore four seeded motion directions with gentle, lively and texture families.
- Keep motion favourites in the preset library and protect selected settings.
- Select frame ranges or add frames to a selection; batch holds, reverse, duplicate, move and delete.
- Create named clips from selected frames and use Focus canvas.
- Layer-motion switching and restoration have been corrected; Odd Little Marks v1.5 remains compatible.

Keep exploring

Use the editable examples and in-app help to try another direction. Save a copy before experimenting with an important project.

The controls described here are included in this version. Optional local tools are identified in the practical details; they do not run continuously.

Save, share & connect

Files you can keep

- .jago editable drawing projects
- PNG stills and timed PNG frame sequences
- Animated GIF
- Sprite sheets with JSON positions, order and holds

Connected workflows

- Dither: print a still or timed drawing loop.
- Repeat: use a drawing as a pattern motif.
- Material / Library: use rendered artwork as a surface or layout asset.

Practical details

Visual exports are silent; attached audio is for project preview.

GIF has palette and hard-transparency limits; use PNG for soft transparency.

Rendered transfers retain the rendered appearance; they do not make every layer editable in another studio.

Opening: Extract the complete ZIP and open Jago-Wobble.exe, or Jago-Wobble.html in a current Edge/Chrome browser. Keep support folders together.

Jago Dither

Pictures into patterns.

Turn artwork into limited-colour prints, character grids and layered ink effects. Work with still images or bounded short clips, then refine the result instead of accepting a fixed filter.

Your first few minutes

1. Add image / clip or open an editable example.
2. Choose inks or a technique; use Explore print directions to compare alternatives.
3. Apply a direction, then play the loop and refine motion or stable print.
4. Save .jagodither, then export artwork, a loop or a print kit.

Version 1.7.0 | Windows and offline browser edition

What you can do

Jago Dither 1.7.0

- Dithering, palette reduction, character-grid treatments and reusable recipes.
- Editable image/text/gradient layers and atmospheric overlays.
- Layered inks with direct on/off controls, screens, registration, opacity and print effects.
- Compare original and printed artwork, export proofs and coverage plates.
- Palette exchange through GPL, JSON and plain hexadecimal colours.

A useful way to work

Wobble: print a drawing loop or return rendered frames.

Keep your editable project alongside finished exports. A rendered image, audio file or video preserves the result; the native project preserves the editing controls.

In this update

New tools and refinements

• Import a supported short video as embedded editable frame layers, with trim, sampling, sizing and cancellation.

• Stable print preserves source motion while controlling extra texture/registration movement.

• Silent exact-timeline MP4/WebM output and consistent GIF palette tables.

• Explore four seeded print directions, respect colour/texture/motion locks and keep eight named project favourites.

• A source-free moving-print example makes the workflow easy to try.

Keep exploring

Use the editable examples and in-app help to try another direction. Save a copy before experimenting with an important project.

The controls described here are included in this version. Optional local tools are identified in the practical details; they do not run continuously.

Save, share & connect

Files you can keep

- .jagodither projects and .ditherrecipe settings
- PNG artwork, comparisons and coverage-plate kits
- GIF and PNG frame sequences with timing
- Silent MP4/WebM
- Palettes and character-grid text

Connected workflows

- Wobble: print a drawing loop or return rendered frames.
- Repeat: build a repeat from a printed motif.
- Pulse: export a short visual clip or frames and import through supported file routes.
- Library: collect proofs and use artwork in layouts.

Practical details

Clip import: 0.25-12 seconds, up to 288 frames and bounded memory; codec availability varies.

Video output is silent and opaque, at most 2048 pixels per edge / four million pixels.

Direction comparisons show the current still frame; play the loop after applying.

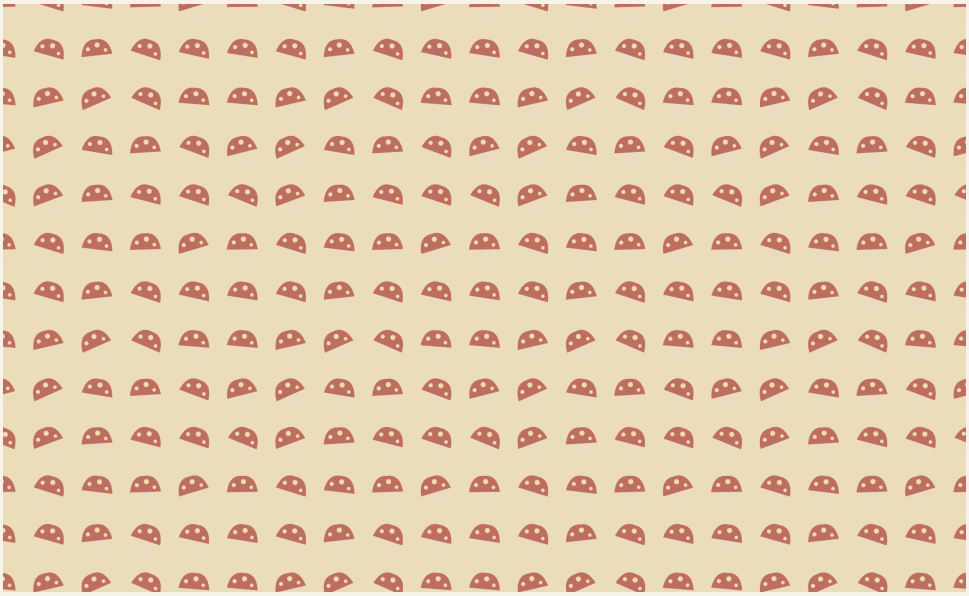

Coverage plates are creative RGB separations, not calibrated CMYK proofs.

Opening: Extract the complete ZIP and open Jago-Dither.exe, or Jago-Dither.html in a current Edge/Chrome browser. Keep support folders together.

Jago Repeat

Make something that carries on.

Build seamless patterns from artwork, arrange motifs and repair repeating textures. Explore generated layouts, then keep control of the details.

Your first few minutes

1. Add a motif or open a pattern study.
2. Explore a layout family, lock what you like and compare variations.
3. Edit motif groups or freeze an arrangement for individual placement.
4. Inspect the repeat proof, save .jagorepeat and export a tile or kit.

Version 1.13.0 | Windows and offline browser edition

What you can do

Jago Repeat 1.13.0

- Tile dimensions, spacing, motif sizes, rotation, mixing and controlled variation.
- Linked/mirrored sets, overlap protection and editable frozen occurrences.
- Independent seeds and layout locks; reusable repeat recipes.
- Wrap-aware texture painting, erasing and cloning; seam repair and repeat proofing.
- Still tiles, larger filled sheets and moving pattern exports.

A useful way to work

Material: use the tile as a repeating surface or fill.

Keep your editable project alongside finished exports. A rendered image, audio file or video preserves the result; the native project preserves the editing controls.

In this update

New tools and refinements

- Prominent ordered, flowing and graphic exploration families with related variations.
- Save eight named project directions with previews and restore them later.
- Bulk movement, scale, rotation, alignment and distribution of motif groups.
- Move proof seams to the centre and export a guide proof without changing the tile.
- Comparison cancellation, playback and frozen-source restoration fixes.

Keep exploring

Use the editable examples and in-app help to try another direction. Save a copy before experimenting with an important project.

The controls described here are included in this version. Optional local tools are identified in the practical details; they do not run continuously.

Save, share & connect

Files you can keep

- .jagorepeat projects and .repeatrecipe settings
- PNG, JPEG, WebP and supported SVG artwork
- GIF, video and PNG-sequence loops
- Tile kits with proof, manifest and optional project/recipe

Connected workflows

- Material: use the tile as a repeating surface or fill.
- World: use a colour tile as a scaled, rotated repeating map surface.
- Library: prepare pattern sheets and production layouts.

Practical details

Recipes store layout settings, not the complete artwork or manual placements.

Raster sources remain raster inside SVG.

Seam repair can soften detail; inspect the repeated proof.

Still tile kits capture one phase; use loop export for motion.

Opening: Extract the complete ZIP and open Jago-Repeat.exe, or Jago-Repeat.html in a current Edge/Chrome browser. Keep support folders together.

Jago World

Give your ideas a world.

Connect characters, lore, scenes, timelines and maps in one editable setting. Build a reference for a story, game or imagined place and share readable views of it.

Your first few minutes

1. Start a world or open an example; add entries and connect them.
2. Create a map and choose a generated geography or build it yourself.
3. Shape the coast, add map details and apply a repeating surface if useful.
4. Save .jagoworld, then export a readable reference or map.

Version 0.23.0 | Windows and offline browser edition

What you can do

Jago World 0.23.0

- Linked world entries, writing, scenes, maps, timelines and reading views.
- Illustrated or imported character portraits and connected family relationships.
- Family-tree focus, folding, search and styled presentations.
- Map artwork, markers, legends, scale bars, atmosphere and repeatable surfaces.
- World-bible and reference exports; project audio attachments.

A useful way to work

Material / Repeat: import colour tiles for land, water, floors and other map roles.

Keep your editable project alongside finished exports. A rendered image, audio file or video preserves the result; the native project preserves the editing controls.

In this update

New tools and refinements

- Harbour and landmass generation has more varied coastlines, spacing and small islands.
- Brush-based coastline shaping makes large node sets easier to edit.
- Staged map-surface editing with role previews, scale, rotation and offsets.
- Group-aware alignment, equal gaps and stronger world checks.
- Clearer material/repeat surface workflow; colour tiles remain visual surfaces.

Keep exploring

Use the editable examples and in-app help to try another direction. Save a copy before experimenting with an important project.

The controls described here are included in this version. Optional local tools are identified in the practical details; they do not run continuously.

Save, share & connect

Files you can keep

- .jagoworld projects
- World-bible Markdown, readable HTML and structured JSON
- Reference ZIP bundles
- Map PNG/SVG/data and styled family-tree/portrait artwork

Connected workflows

- Material / Repeat: import colour tiles for land, water, floors and other map roles.
- Sound: attach rendered music or ambience with the editable original where supported.
- Library: organise maps, portraits and reference exports.

Practical details

Generation is artistic rather than a physical geography simulation.

Private export fields do not remove secrets written in ordinary prose; review before sharing.

Spelling depends on the browser/Windows engine.

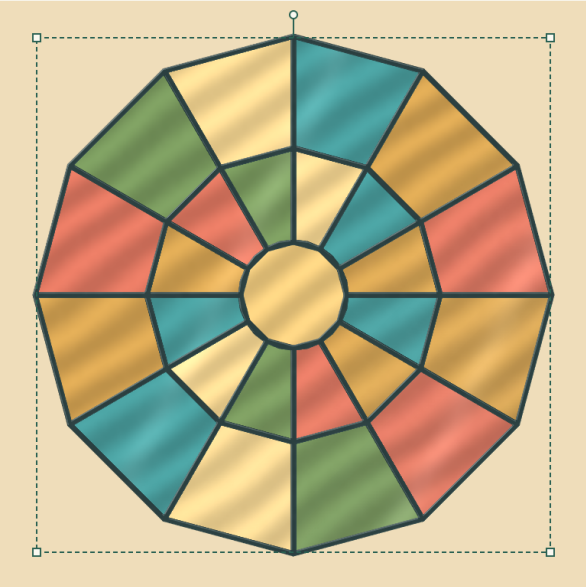

Project audio is manually played; it does not automatically follow locations or become part of map images.

Opening: Extract the complete ZIP and open Jago-World.exe, or Jago-World.html in a current Edge/Chrome browser. Keep support folders together.

Jago Material

Make surfaces with character.

Create textured artwork, lettering and repeatable surfaces. Combine generated materials, scanned textures and your own marks, then export artwork or explicit surface channels.

Your first few minutes

1. Choose a material example or import a scanned texture.
2. Add text or artwork, then choose foil, ink, emboss, deboss or raised lettering.
3. Compare finishes and adjust grain, light and mark treatment.
4. Save .jagomaterial; export artwork, .jagotexture or a channel kit.

Version 0.16.0 | Windows and offline browser edition

What you can do

Jago Material 0.16.0

- Procedural wood, glass, metal and other editable material families.
- Imported/scanned image textures with independent repeat scale, rotation and offsets.
- Editable shapes, lettering, artwork masks, surface layers and lighting preview.
- Roughness/metallic controls and optional relief or explicit channel maps.
- Seeded Surprise me, texture library, tile inspection and motion exports.

A useful way to work

Repeat: inspect and arrange repeatable textures.

Keep your editable project alongside finished exports. A rendered image, audio file or video preserves the result; the native project preserves the editing controls.

In this update

New tools and refinements

- Refined foil, emboss and deboss impressions with before/after comparison.
- Gold, silver, copper, rose-gold and platinum finish choices.
- Raised metal lettering from editable text, embedded fonts or rendered silhouettes.
- Compressed leather grain and separate surface-channel treatment.
- Eight editable finish/lettering examples plus additional starters.

Keep exploring

Use the editable examples and in-app help to try another direction. Save a copy before experimenting with an important project.

The controls described here are included in this version. Optional local tools are identified in the practical details; they do not run continuously.

Save, share & connect

Files you can keep

- .jagomaterial projects and presets
- .jagotexture prepared surfaces
- PNG colour artwork, transparent selected layers and repeat sheets
- Timed PNG sequence ZIPs
- Surface-map ZIP: colour, height, roughness, metallic, normal, ORM and opacity

Connected workflows

- Repeat: inspect and arrange repeatable textures.
- World: use a colour tile as a map surface.
- Wobble: bring in rendered animation or export timed frames.
- Library: organise texture kits and use finishes in layouts.

Practical details

Raised lettering is rendered 2D artwork, not an exported 3D mesh.

Surface maps are artistic estimates, not measured scans; lighting is a preview.

ORM uses neutral occlusion; brightness relief is optional.

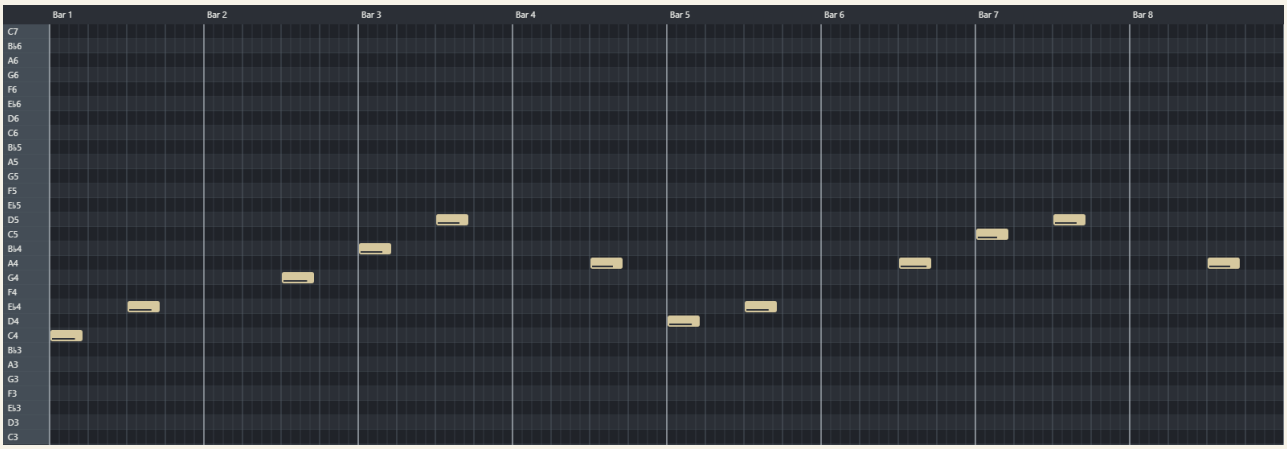

Channel kits capture time zero; check all channels when repairing a seam.

Opening: Extract the complete ZIP and open Jago-Material.exe, or Jago-Material.html in a current Edge/Chrome browser. Keep support folders together.

Jago Sound

Make a little noise. Or a whole song.

Compose editable music, invent sound effects and build ambience offline. Begin from a score, an example, a seeded idea or an empty composition and shape it yourself.

Your first few minutes

1. Create a blank song or choose an example, score or generation approach.

2. Generate or compare alternatives, then edit notes, sections and parts.

3. Use Mix parts and hear the melody/details together; shape performance if useful.

4. Save .jagomusic; export WAV for the sound or MIDI for the note arrangement.

Version 0.10.0 | Windows and offline browser edition

What you can do

Jago Sound 0.10.0

- Editable parts, note patterns, song sections, instruments and a visible mixer.
- Seeded complete-song approaches, feelings, arrangements, locks and alternatives.
- MIDI score import with supported full-score or passage choices.
- Sound Workshop combines editable tones, noise, impacts and recordings.
- Separate working-track and sound-recipe folders; native project backups.

A useful way to work

World / Library: supported WAV transfers can carry the editable original.

Keep your editable project alongside finished exports. A rendered image, audio file or video preserves the result; the native project preserves the editing controls.

In this update

New tools and refinements

- Ensemble-led generation adds an answering approach to the existing families.
- Natural phrasing, stronger accents and performance shaping vary note strength/articulation.
- Mix parts shows level, pan, mute/solo together; shape notes previews edits with Undo.
- Invent from ingredients adds mechanisms, clusters, pulses and evolving loops.
- Check loop join plays two consecutive copies; stereo transfers retain both channels.
- Give the melody room coordinates generated details; existing songs have an explicit undoable coordination action.

Keep exploring

Use the editable examples and in-app help to try another direction. Save a copy before experimenting with an important project.

The controls described here are included in this version. Optional local tools are identified in the practical details; they do not run continuously.

Save, share & connect

Files you can keep

- .jagomusic compositions
- Stereo WAV mixes, effects and supported stem/export kits
- MIDI arrangements
- .jagosound recipes and WAV + recipe ZIPs

Connected workflows

- World / Library: supported WAV transfers can carry the editable original.
- Pulse: import an exported WAV for analysis and music-led visuals; this is a file workflow.
- Library: send supported MIDI into Sound and organise audio assets.

Practical details

Compact compositions are bounded to three minutes; custom recipes use up to eight ingredients and 30 seconds.

MIDI does not preserve Jago synthesis, every controller automation or arbitrary tempo changes.

Loop inspection helps you judge a join; it does not guarantee every recipe is seamless.

Review bundled score licences and the rights of imported audio.

Opening: Extract the complete ZIP and open Jago-Sound.exe, or Jago-Sound.html in a current Edge/Chrome browser. Keep support folders together.

Jago Library

A home for your creative projects.

Browse assets and fonts, organise projects, build reference boards and production layouts, and work with documents. Keep linked originals where you choose or collect verified copies deliberately.

Your first few minutes

1. Start a project or link an asset folder; files remain references unless collected.
2. Use Fonts, Documents or another category; double-click a category to clear its filters.
3. Create a board or Production layout; save reusable designs in My templates.
4. Check Project health, save the project and collect/package originals when portability matters.

Version 0.10.4 | Windows and offline browser edition

What you can do

Jago Library 0.10.4

- Asset search, tags, favourites, installed-font discovery and specimens.
- Production layouts, editable text, image frames, templates and contact sheets.
- PDF viewing, page tools, conversion to Word and local OCR options.
- Linked folders, nested collections and editable .jagolibrary projects.
- Cross-studio asset routes for artwork, textures, font specimens, audio and MIDI.

A useful way to work

Board: a focused Library entry point, not a separate studio.

Keep your editable project alongside finished exports. A rendered image, audio file or video preserves the result; the native project preserves the editing controls.

In this update

New tools and refinements

- Office previews and local PDF conversion for supported Word, slide and spreadsheet files.
- Live linked-source refresh, missing-file review and fingerprint-based relocation.
- Project health, duplicate checking, document revision comparison and export history.
- Reusable template shelf, portable .jagokit packages, briefs, brand kits and delivery profiles.
- Jago Board adds reference-canvas launch, auto-arrange, rectangle selection, snapping and sized exports.
- Production adds frame/content control and bounded trimmed video layers, overlays and short video exports.
- Capture inbox and selectable image-text OCR connect Companion assets to a project.

Keep exploring

Use the editable examples and in-app help to try another direction. Save a copy before experimenting with an important project.

The controls described here are included in this version. Optional local tools are identified in the practical details; they do not run continuously.

Save, share & connect

Files you can keep

- .jagolibrary projects, .jagokit portable kits and .jagotemplate templates
- PNG/JPEG/WebP, supported SVG and PDF layouts
- Board images with size/padding/transparency controls
- Supported short video exports and frame extraction
- PDF-to-DOCX, page images, text/HTML, detected-cell CSV and geometry JSON

Connected workflows

- Board: a focused Library entry point, not a separate studio.
- Companion: shared capture folder and local image text.
- Sound: supported MIDI/audio routes.
- Material / Repeat / Dither / Wobble: compatible artwork and rendered font specimens.

Practical details

Office page rendering requires the optional local LibreOffice renderer; browser previews differ.

PDF reconstruction and OCR use optional Windows tools and may need cleanup.

Linked sources must remain available unless copied or embedded.

Project scans are bounded; proprietary formats depend on compatible embedded previews.

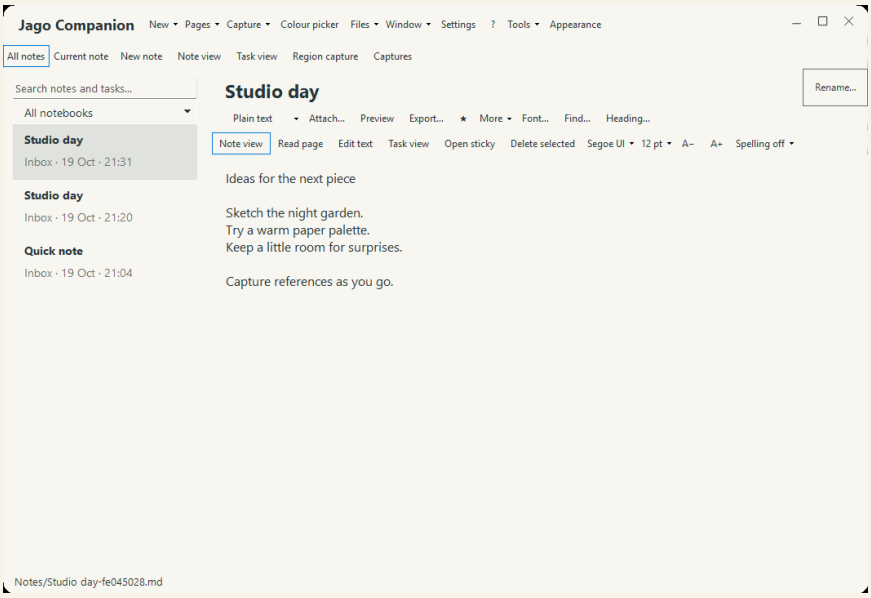

Export again can copy a remembered output; it does not automatically re-render edits.

Opening: Extract the complete ZIP and open Jago-Library.exe, or Jago-Library.html in a current Edge/Chrome browser. Keep support folders together.

Jago Companion

Keep the little things close.

Quick notes, floating tasks, screenshots, video snippets and file previews in a lightweight offline companion. Use the notebook, keep a sticky beside your work or capture something without breaking your flow.

Your first few minutes

1. Open Companion and write; name the page separately from its contents.
2. Use Note view or Task view for the same page; Open sticky floats it.
3. Choose Capture or the Jago Capture launcher; annotate and save a new copy.
4. Try Colour picker or enable Explorer previews in Settings if you want them.

Version 0.7.3 | Windows application

What you can do

Jago Companion 0.7.3

- Named notes with autosave, search, formatted reading, source editing and task views.
- Independent floating stickies with their own background, font, opacity, pinning and position.
- Region/window/display screenshots, PNG/JPEG preferences and annotations.
- Video snippets with optional sound, microphone and live drawing.
- Capture launcher, optional widget, email-signature designer and configurable shortcuts.

A useful way to work

Workscape: tab, narrow panel or floating note.

Keep your editable project alongside finished exports. A rendered image, audio file or video preserves the result; the native project preserves the editing controls.

In this update

New tools and refinements

- Selectable offline text recognition in image captures.
- Optional Explorer Space previews for images/GIFs, audio/video, PDFs, Markdown and text; off by default.
- Video/audio preview Loop and one-click Replay; safer seeking.
- Screen colour picker with magnifier, HEX/RGB copy and twelve local recent swatches.
- Workscape tab/sidebar/floating modes, capture inbox connection and refined small-window controls.

Keep exploring

Use the editable examples and in-app help to try another direction. Save a copy before experimenting with an important project.

The controls described here are included in this version. Optional local tools are identified in the practical details; they do not run continuously.

Save, share & connect

Files you can keep

- Local note files, portable backups and supported note exports
- PNG/JPEG captures and edited copies
- MP4 snippets
- Signature HTML and copied colour/text values

Connected workflows

- Workscape: tab, narrow panel or floating note.
- Library: capture inbox and asset organisation.
- Independent use: notebook, capture, previews and picker work without another studio.

Practical details

Windows only; needs .NET Framework 4.8. PDF/Markdown preview uses WebView2.

Explorer previews are optional and require Companion running; other file managers are not guaranteed.

Video previews depend on Windows codecs; looping is normal replay, not gapless audio.

OCR uses installed Windows recognition languages. Colour values reflect screenshot pixels, not calibrated physical measurements.

Opening: Extract the complete ZIP and open Jago-Companion.exe. Keep supporting files together. The shared suite installer can install this app on its own.

Jago Pulse

Art, rhythm and motion.

Create music-driven films, visualisers, animated posters and ambient backdrops. Generate source-free visuals or use your artwork, music and fonts, then refine an editable composition.

Your first few minutes

1. Add music from the header; choose full-track length or an excerpt.
2. Choose the visual range and film shape, then Compare 3 alternatives.
3. Use Timing to hear/correct the grid; use Motion and Colour to refine the selected scope.
4. Save .jagopulse, then use Finish or Use elsewhere for output.

Version 0.11.3 | Windows and offline browser edition

What you can do

Jago Pulse 0.11.3

- 47 visual families with 141 named looks in six collections.
- Seeded generation, compare-three alternatives, recipes, protected edits and saved directions.
- Layer stacks, masks, groups, precise motion channels and scene timing.
- Local music analysis, grid audition/correction, attacks, frequency and energy signals.
- Palette roles, evolving colour journeys, finishing filters and custom dimensions.

A useful way to work

Sound: import an exported WAV as a soundtrack.

Keep your editable project alongside finished exports. A rendered image, audio file or video preserves the result; the native project preserves the editing controls.

In this update

New tools and refinements

- Music-led film shapes create contrast, breathing room, recurring motifs and endings.
- Family-specific reactions, slower drift and fixed-centre or moving-perspective styles.
- Surprise me explores palette and cut choreography while respecting locks.
- Generated words have a separate switch; manual scene text and timed lyrics stay distinct.
- Import/edit lyric cues and optionally draft English words using the local transcription pack.
- Editable Workscape tabs preserve the composition and embedded assets.

Keep exploring

Use the editable examples and in-app help to try another direction. Save a copy before experimenting with an important project.

The controls described here are included in this version. Optional local tools are identified in the practical details; they do not run continuously.

Save, share & connect

Files you can keep

- .jagopulse projects, recipes and .jagopalette files
- PNG stills and timed PNG sequences
- Supported MP4/WebM exact-frame exports or playback recording fallback
- Music-excerpt WAV
- Supported timed-text exports

Connected workflows

- Sound: import an exported WAV as a soundtrack.
- Wobble / Repeat / Material / Library: add compatible art, sprite sheets and fonts.
- Dither: exchange a still, supported short clip or frames through file export/import.
- Workscape: editable tabs and saved embedded assets.

Practical details

Beat/cut estimates need listening; energy passages are not recognised musical verses.

Optional local English transcription drafts words/timing and needs correction; no vocal separation.

Video codec/size/alpha options depend on the selected exporter and device.

Rendered outputs are file exchange; broad editable cross-studio round trips are not provided.

Opening: Extract the complete ZIP and open Jago-Pulse.exe, or Jago-Pulse.html in a current Edge/Chrome browser. Keep support folders together.

Formats & optional tools

All core work stays offline

No account or cloud conversion is required for core creative tasks. Engines are local and run when requested. Installing an optional pack or obtaining WebView2 may require a download; creative processing then stays local.

Library document tools

Office renderer: LibreOffice previews supported Word, Excel and PowerPoint files and converts print layouts to PDF. PDF engine: local reconstruction and export operations. OCR: local recognition for supported scanned PDFs. These are separately selectable in setup; document fidelity and font availability matter.

Pulse English lyric draft

The optional whisper.cpp CPU engine and English starter model draft words and timestamps from supplied audio. Sung words need review. This does not separate vocals or guarantee word-perfect timing. The browser edition uses imported or manually edited text.

Companion previews and recognition

Explorer Space previews are optional, off by default and active only while Companion runs. Local PDF/Markdown preview uses WebView2. Image OCR uses installed Windows language support. Video/audio formats depend on codecs. Screen colours are screenshot pixels rather than calibrated display measurements.

Licences travel with components

Retain Notices, upstream licences and corresponding-source material where included. Jago's licence does not replace the licence of a score, font, photograph, model or library you import or redistribute.

Keep your work portable

Save both source and result

A native project keeps editable structure. PNG, WAV, PDF or video is a finished output. Keep both. Save workspace for the session, then save important studio projects independently too.

Collect external dependencies deliberately

Use Library's reviewed collection and .jagokit workflows when you want portable originals. Check project health and missing sources first. Verify the copied kit opens before disconnecting or deleting anything.

Moving to another computer

Copy project files, collected dependencies and Companion's chosen home to a backed-up location. On the other machine, install/extract the tools, reconnect homes and linked folders, then review missing fonts and sources. Installed fonts and optional engines may need separate setup.

Updates and removal

Save and close before updating. The installer remembers its location and selected components. Removing a component removes its known program files; personal project folders remain separate. Never store the only copy of creative work inside a program folder.

A final check before sharing

Open the exported file in another viewer, check the beginning/end or page order, verify linked assets and fonts, and review private world details or recognised lyrics. Automatic generation and conversion are starting points you can refine.
